

# On the Use of Ontologies in the Software Process

**Uwe Aßmann**

**Technische Universität Dresden**

**Institut für Software- und Multimediatechnik**

**[uwe.assmann@inf.tu-dresden.de](mailto:uwe.assmann@inf.tu-dresden.de)**

# Suppose you were Mr Bernhard...

# Suppose you were Mr Bernhard...

**How to build the product data of the next version of the Daimler-Chrysler CLS?**

# What is an Ontology?

## What is a *model*?

- ◇ An abstract representation of something
- ◇ Here: a partial type-based specification

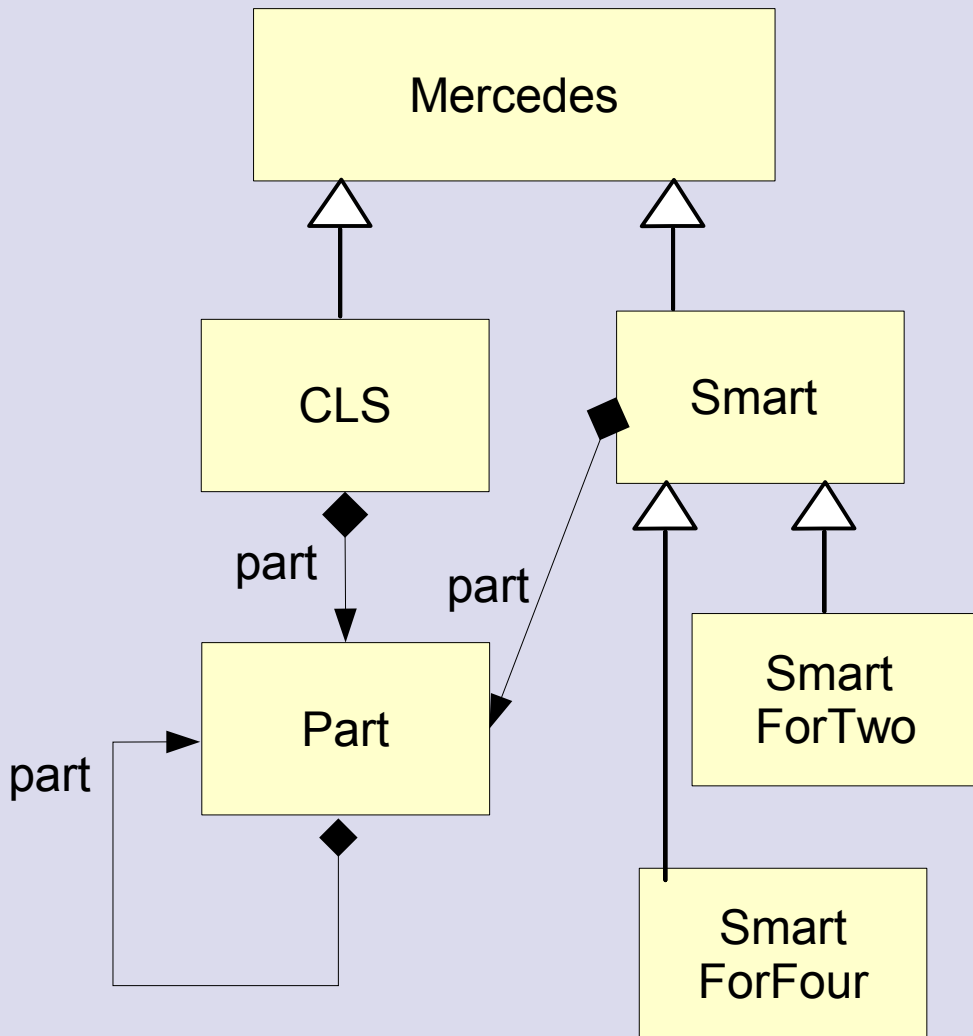

## What is a *taxonomy*?

- ◇ An inheritance hierarchy or lattice of concepts or types

## What is an *ontology*?

- ◇ A taxonomy
- ◇ Plus relations between the concepts
- ◇ Plus integrity constraints, i.e., conditions about the object space (declarative)
- ◇ ***standardized in a domain***
  
- ◇ **For an ontology, you need the consent of many users**

# Car Ontologies

## Invariant:

- ◇ For all  $p$  in  $\text{Smart.part}^*$ :  
if  $p$  in  $\text{CLS.part}^*$   
then  $\text{mustBeCheckedSpecial}(p)$

# What is an Ontology?

**A standardized, logic-based type model of an application domain**

## How to use it in our software??

- ◇ Bioinformatics
- ◇ Medicine
- ◇ Embedded systems
- ◇ Business software
- ◇ Car industry (Daimler CLS)
- ◇ <http://www.daml.org/ontologies/class.html> ....

# Ontology Languages

**A language hierarchy is intended**

**Top Level: „Prolog“ with types and inheritance lattices**

??

---

**SWRL    SWSL (proposals)  
          MOF + OCL (OMG)**

**Recursion  
Integrity constraints**

---

**OWL Full (W3C)**

**Class and relation expressions;  
no recursion**

---

**OWL-Light, DL (W3C)**

---

**RDFS (W3C), MOF (OMG)**

**Taxonomies + Relations**

# How to Use Ontologies in the Software Process

# Standard Object-Oriented Software Development

## A la Booch/Rumbaugh/Jacobsen (3 amigos)

Domain vocabulary.  
Specifications  
for requirements of a  
system

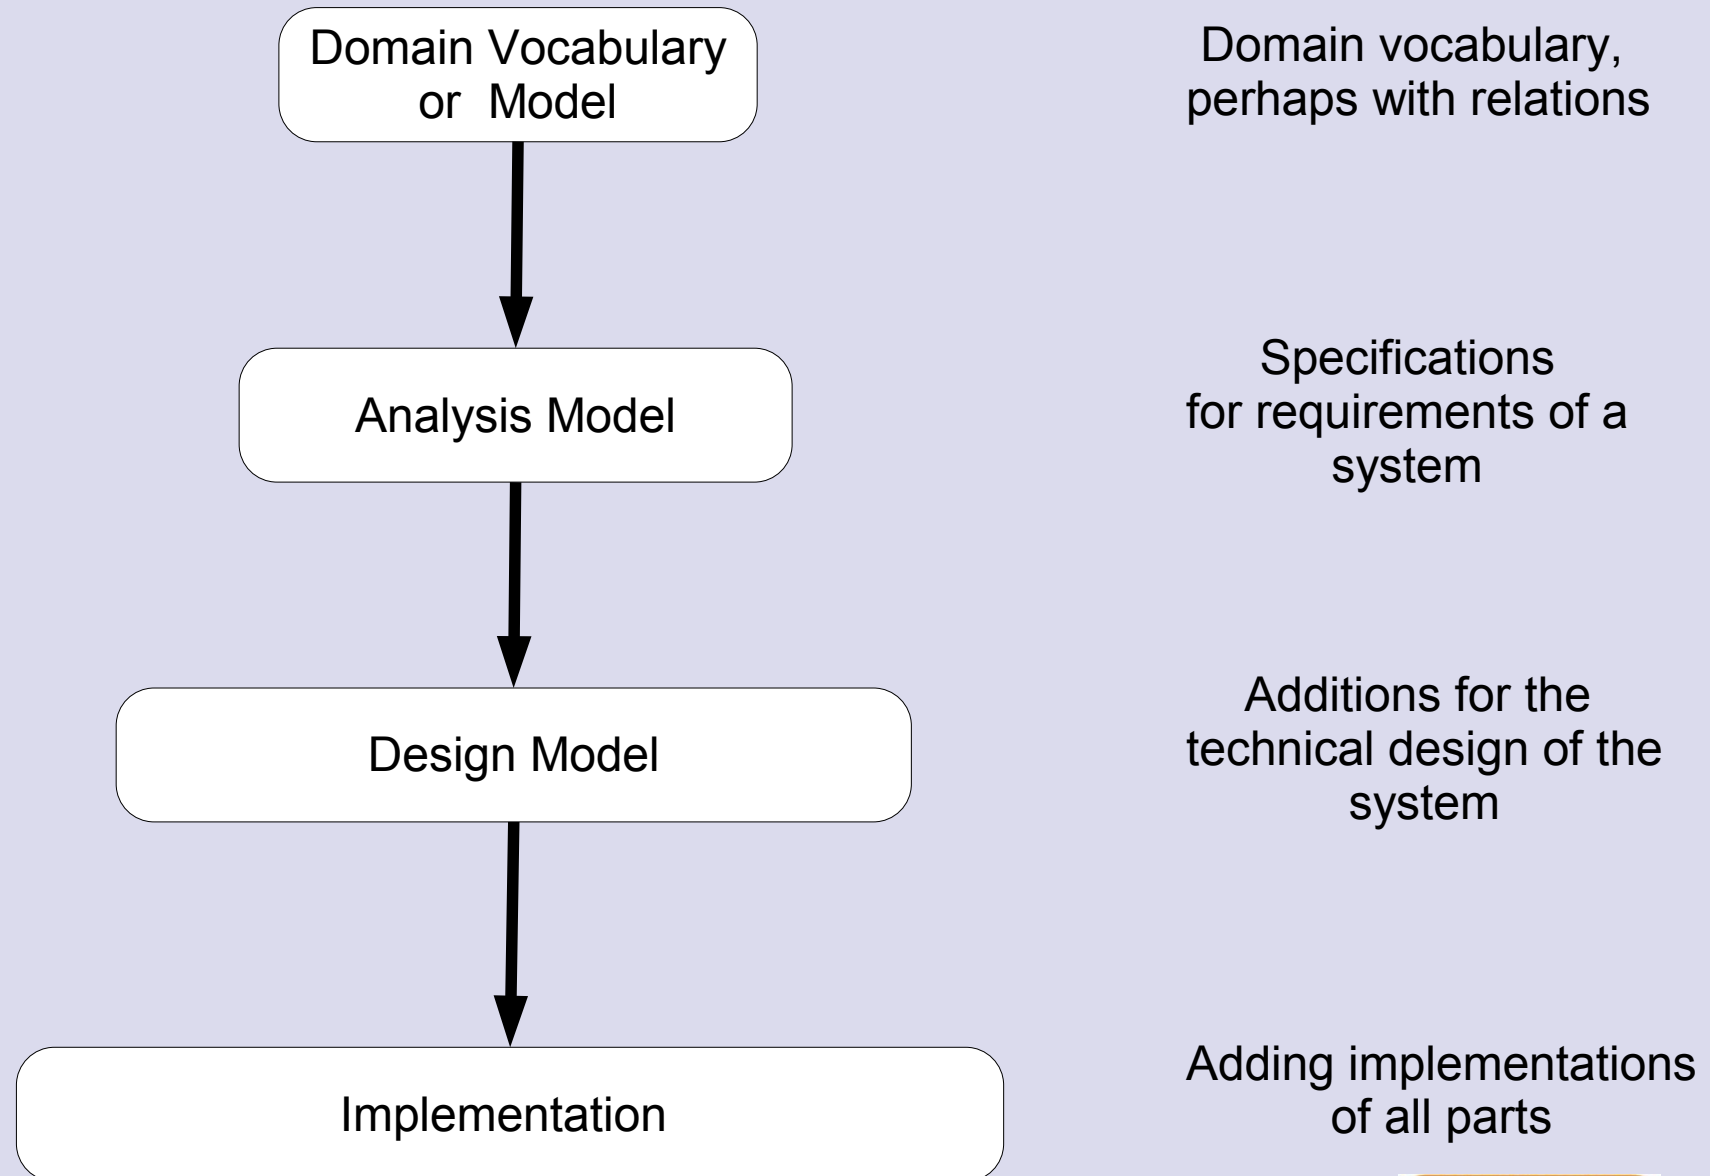

Additions for the  
technical design of the  
system

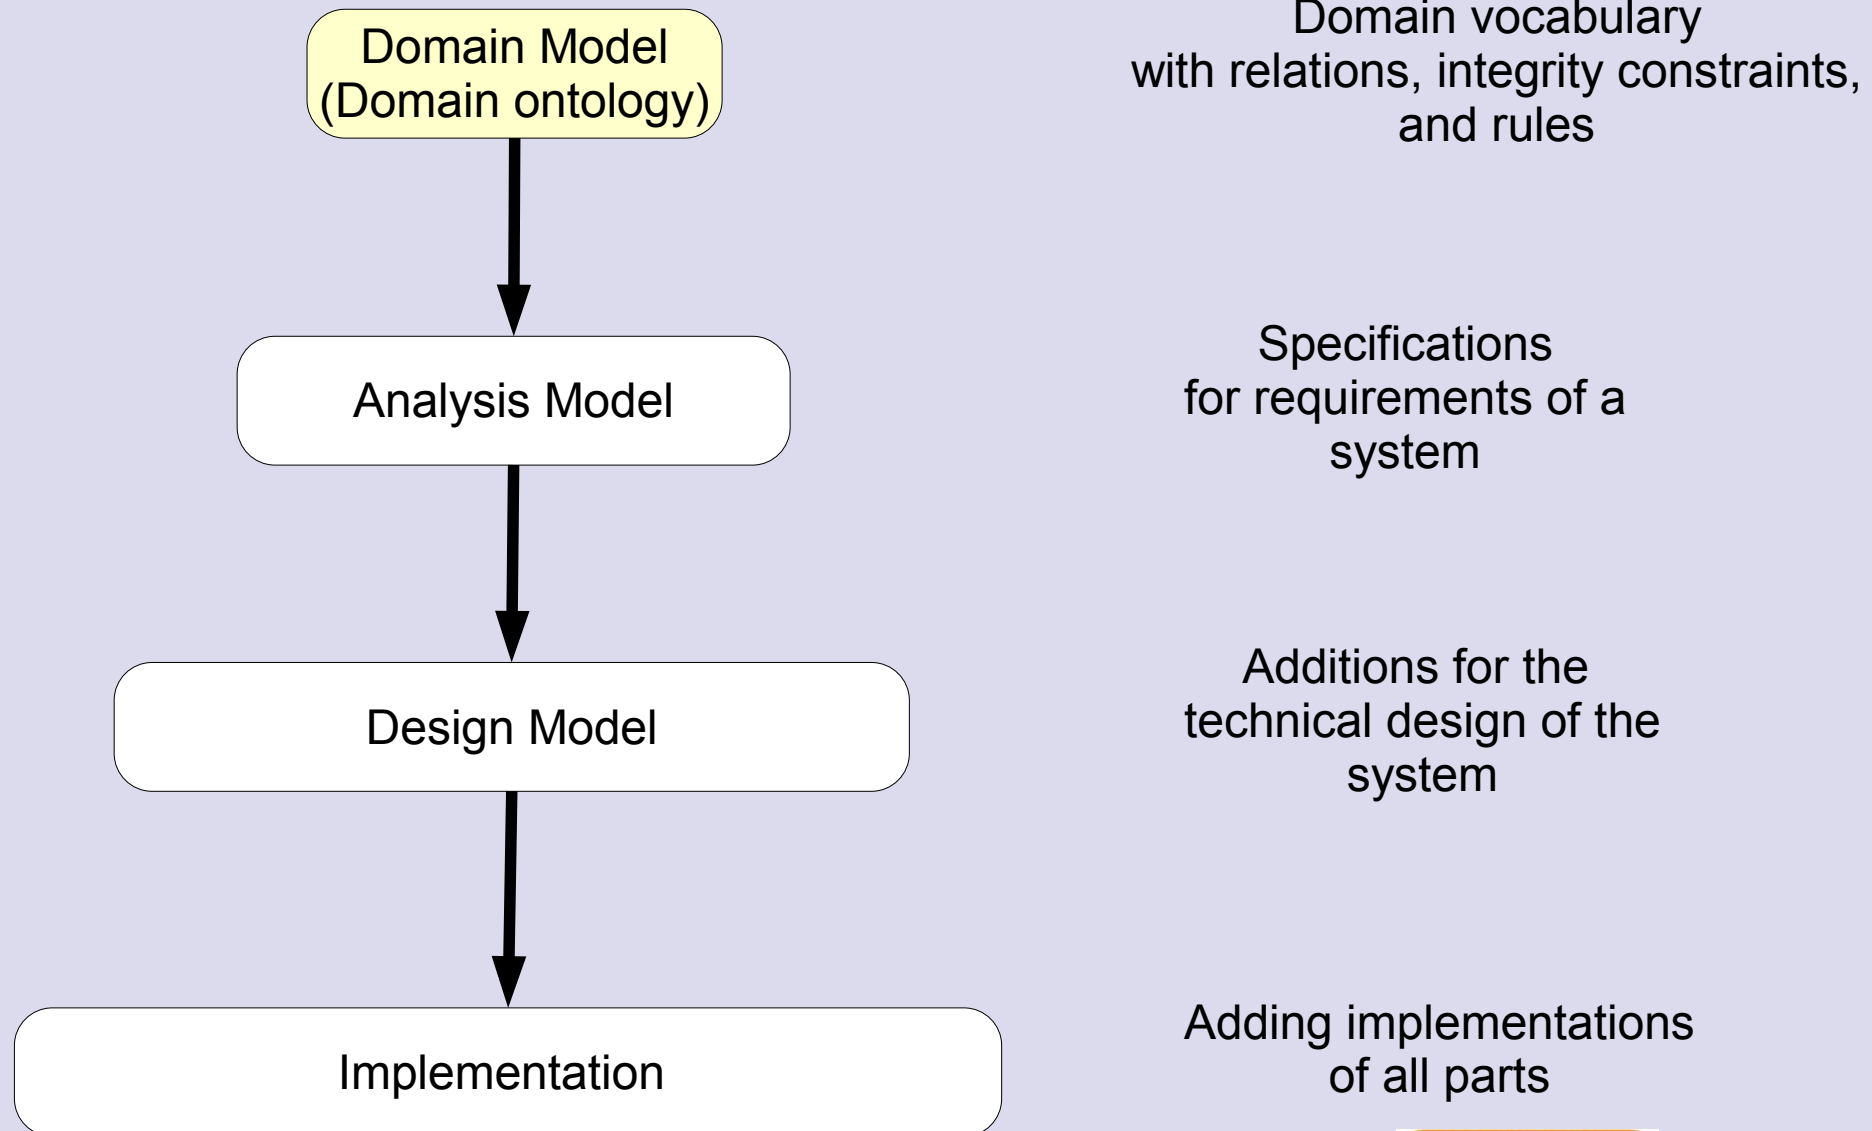

Adding implementations  
of all parts

# Refinement 1: With Domain Analysis

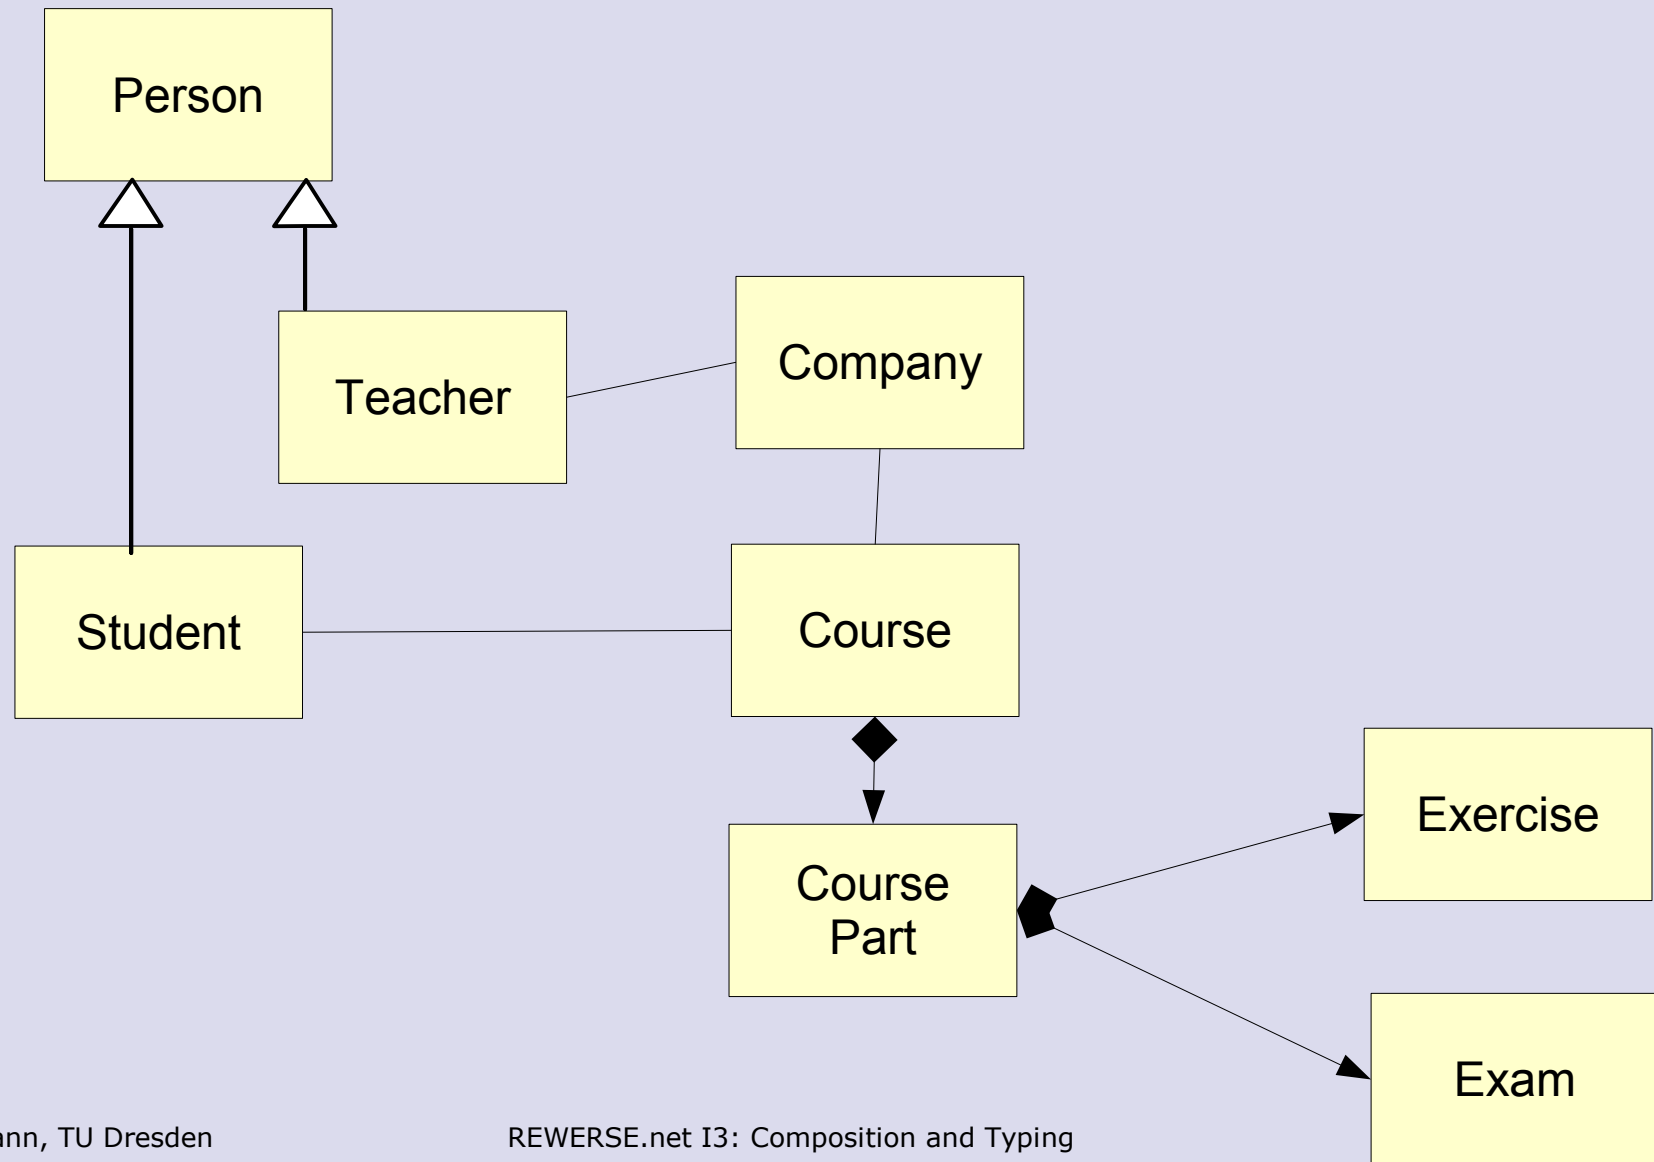

# Refinement 2: With Standardized Ontology

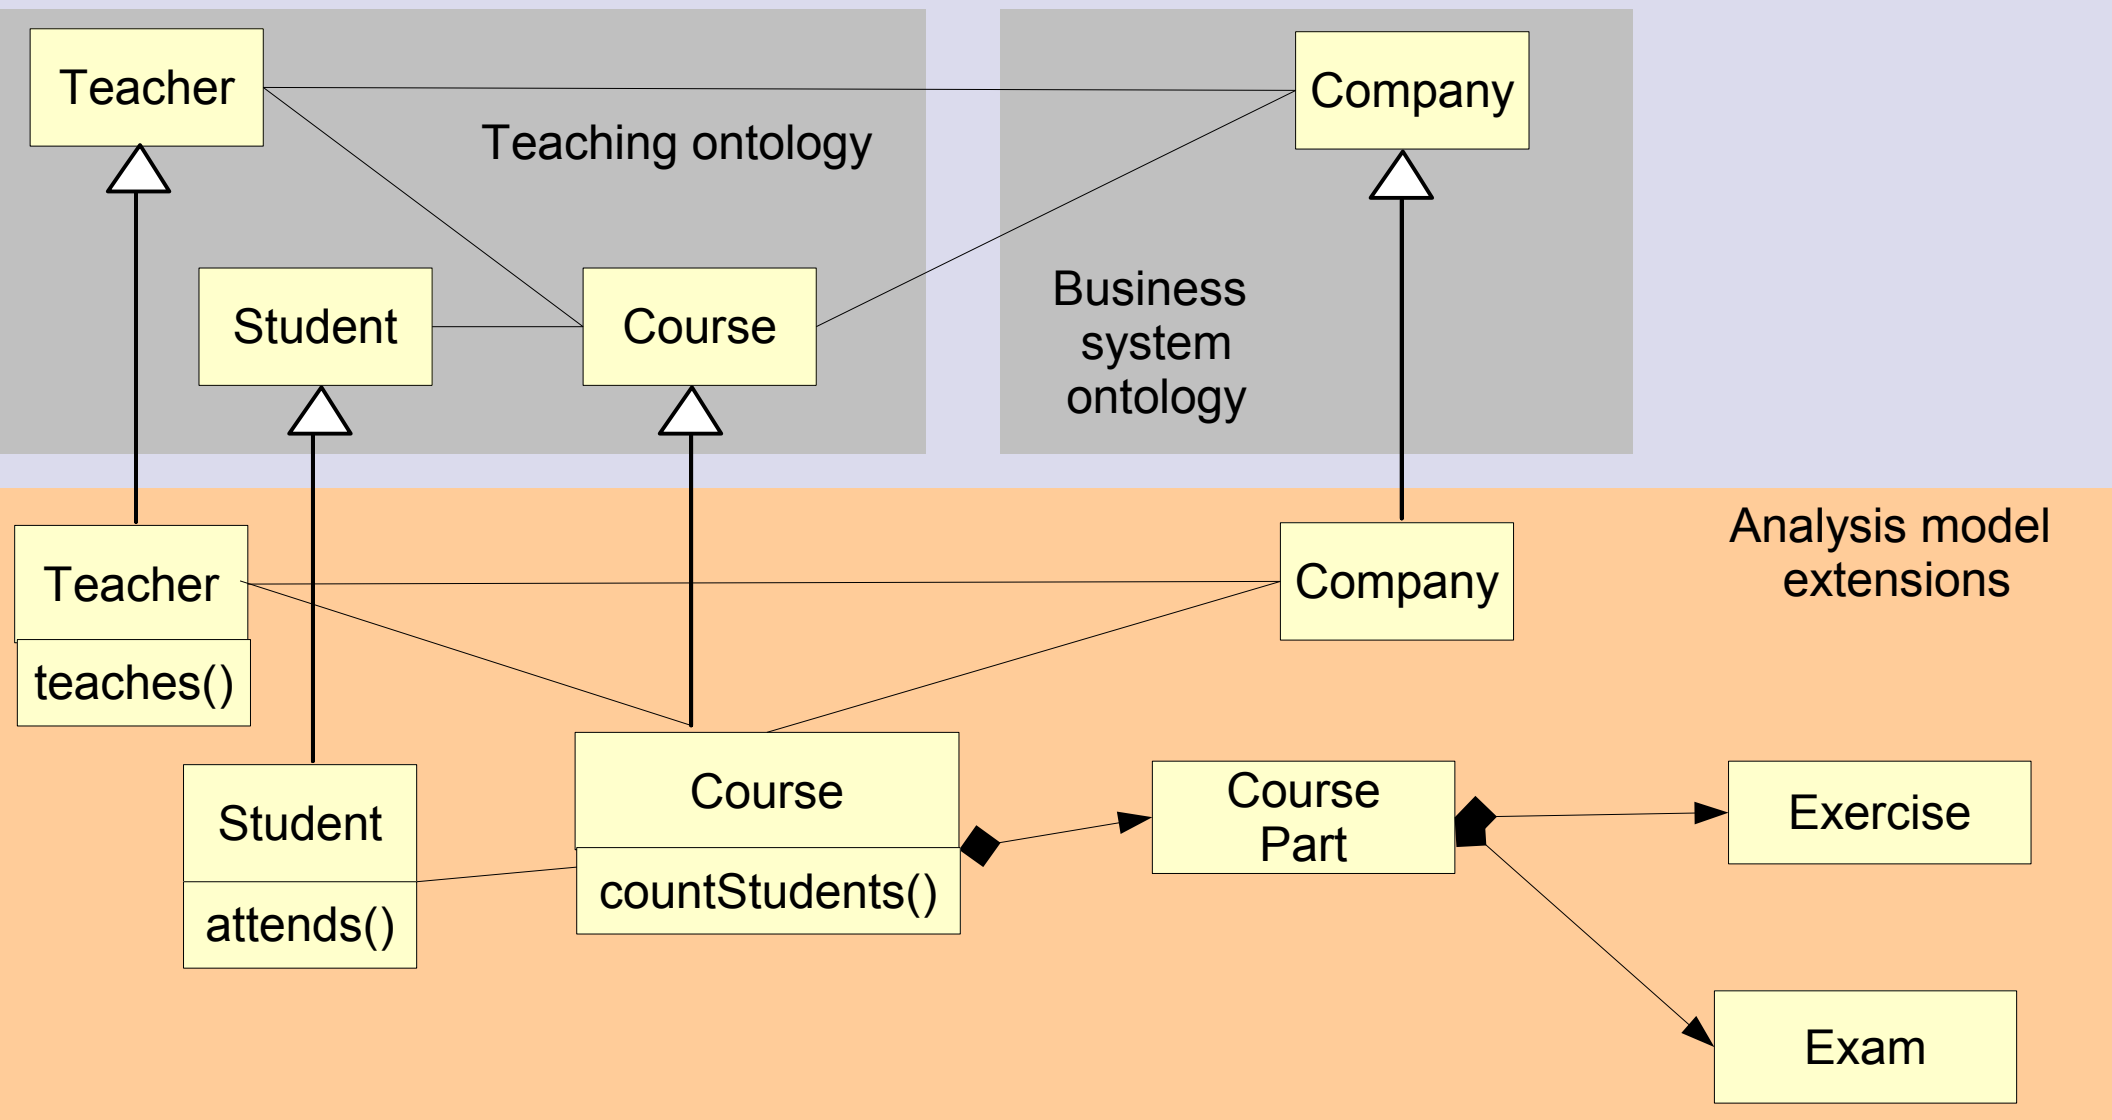

# Today: A Simple Domain Model for a Course Management System

Usually self-made

# Tomorrow: Deriving Models from the Domain Ontologies

**Standardized domain ontologies are reused**

# Tomorrow

**A software product has to be developed around one or several domain ontologies**

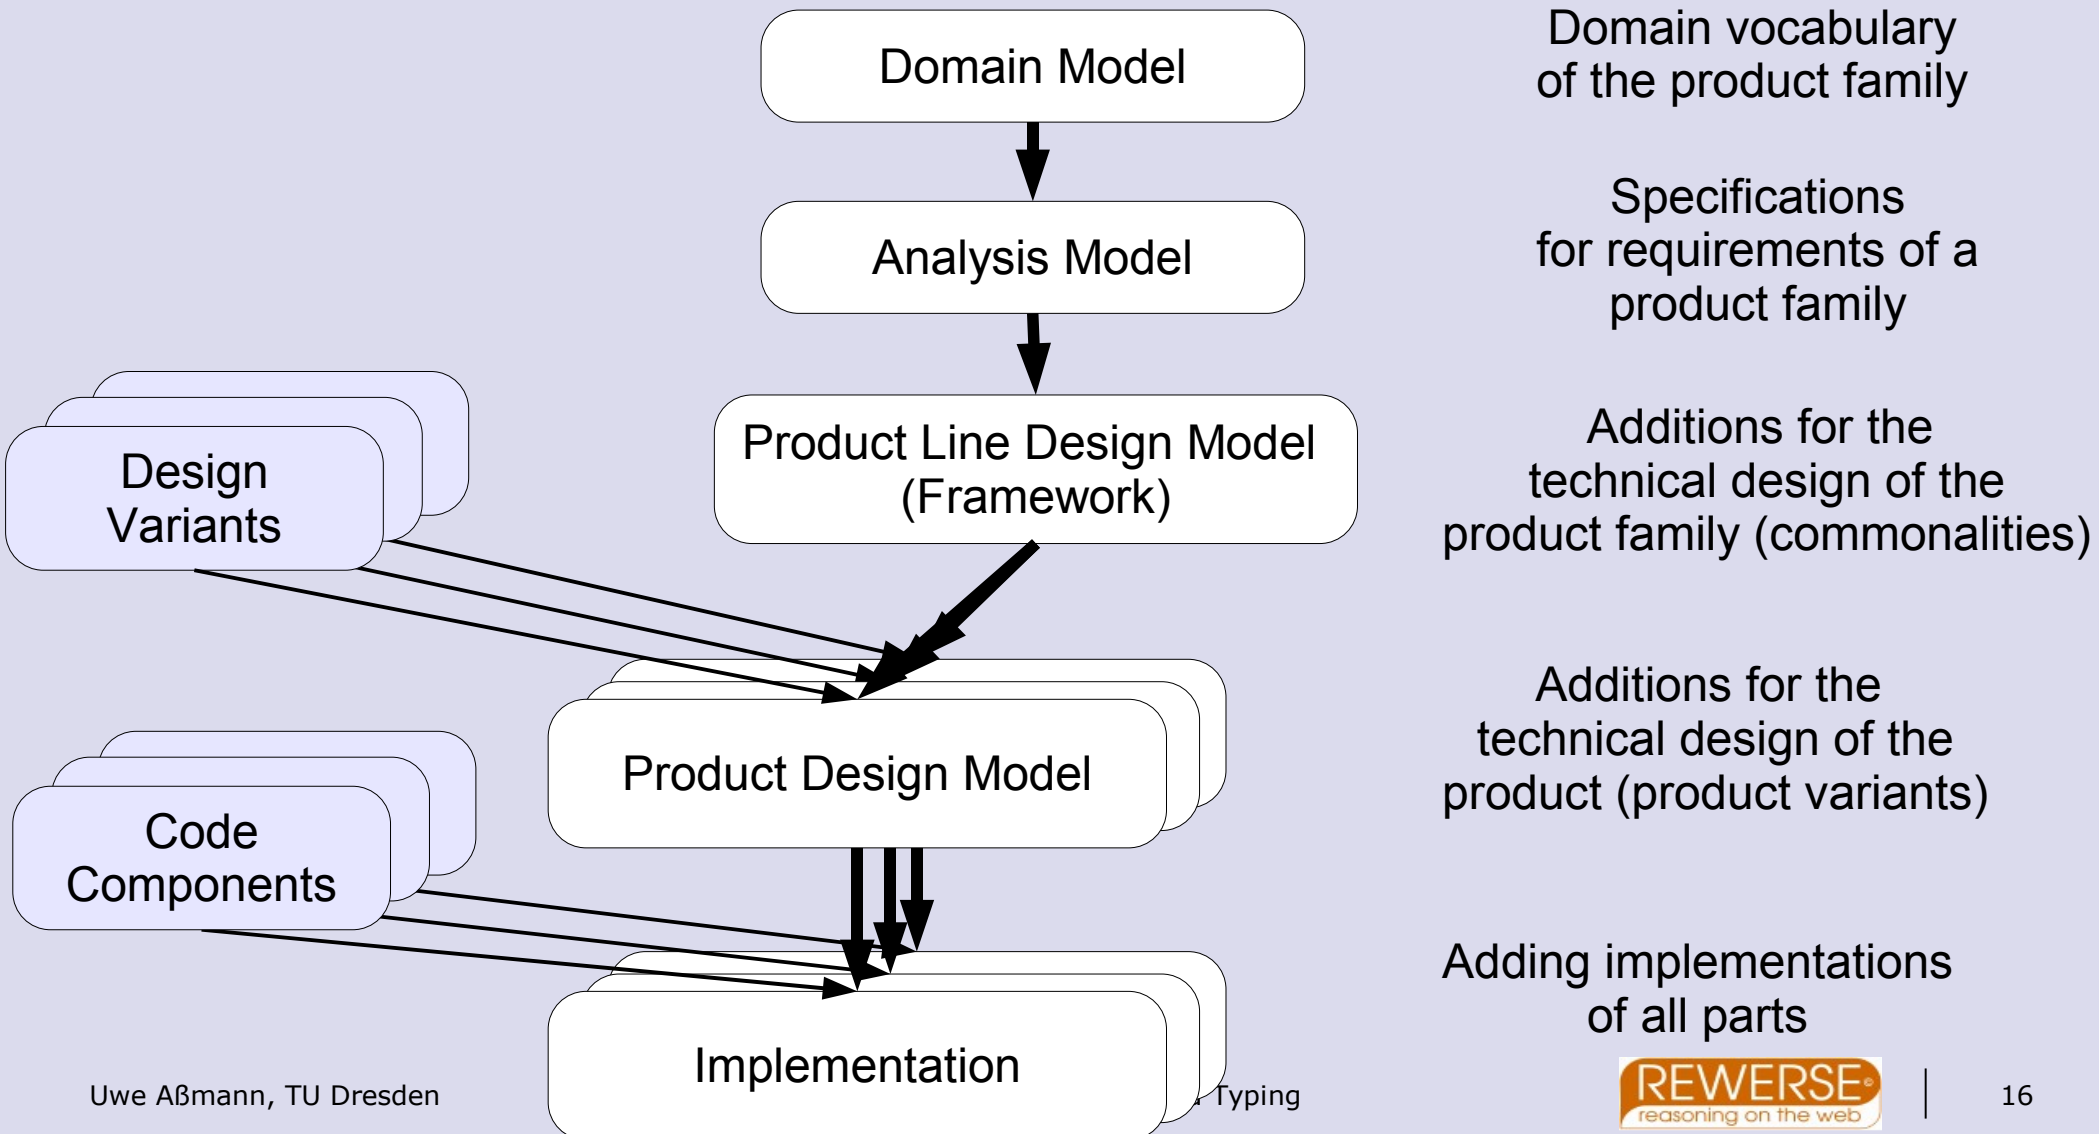

**Because these application experts will use ontologies to express their domain knowledge.**

# Product-Line Development

# Today: Development of Product Lines

## Commonality-Variability Analysis of the domain [DraCo]

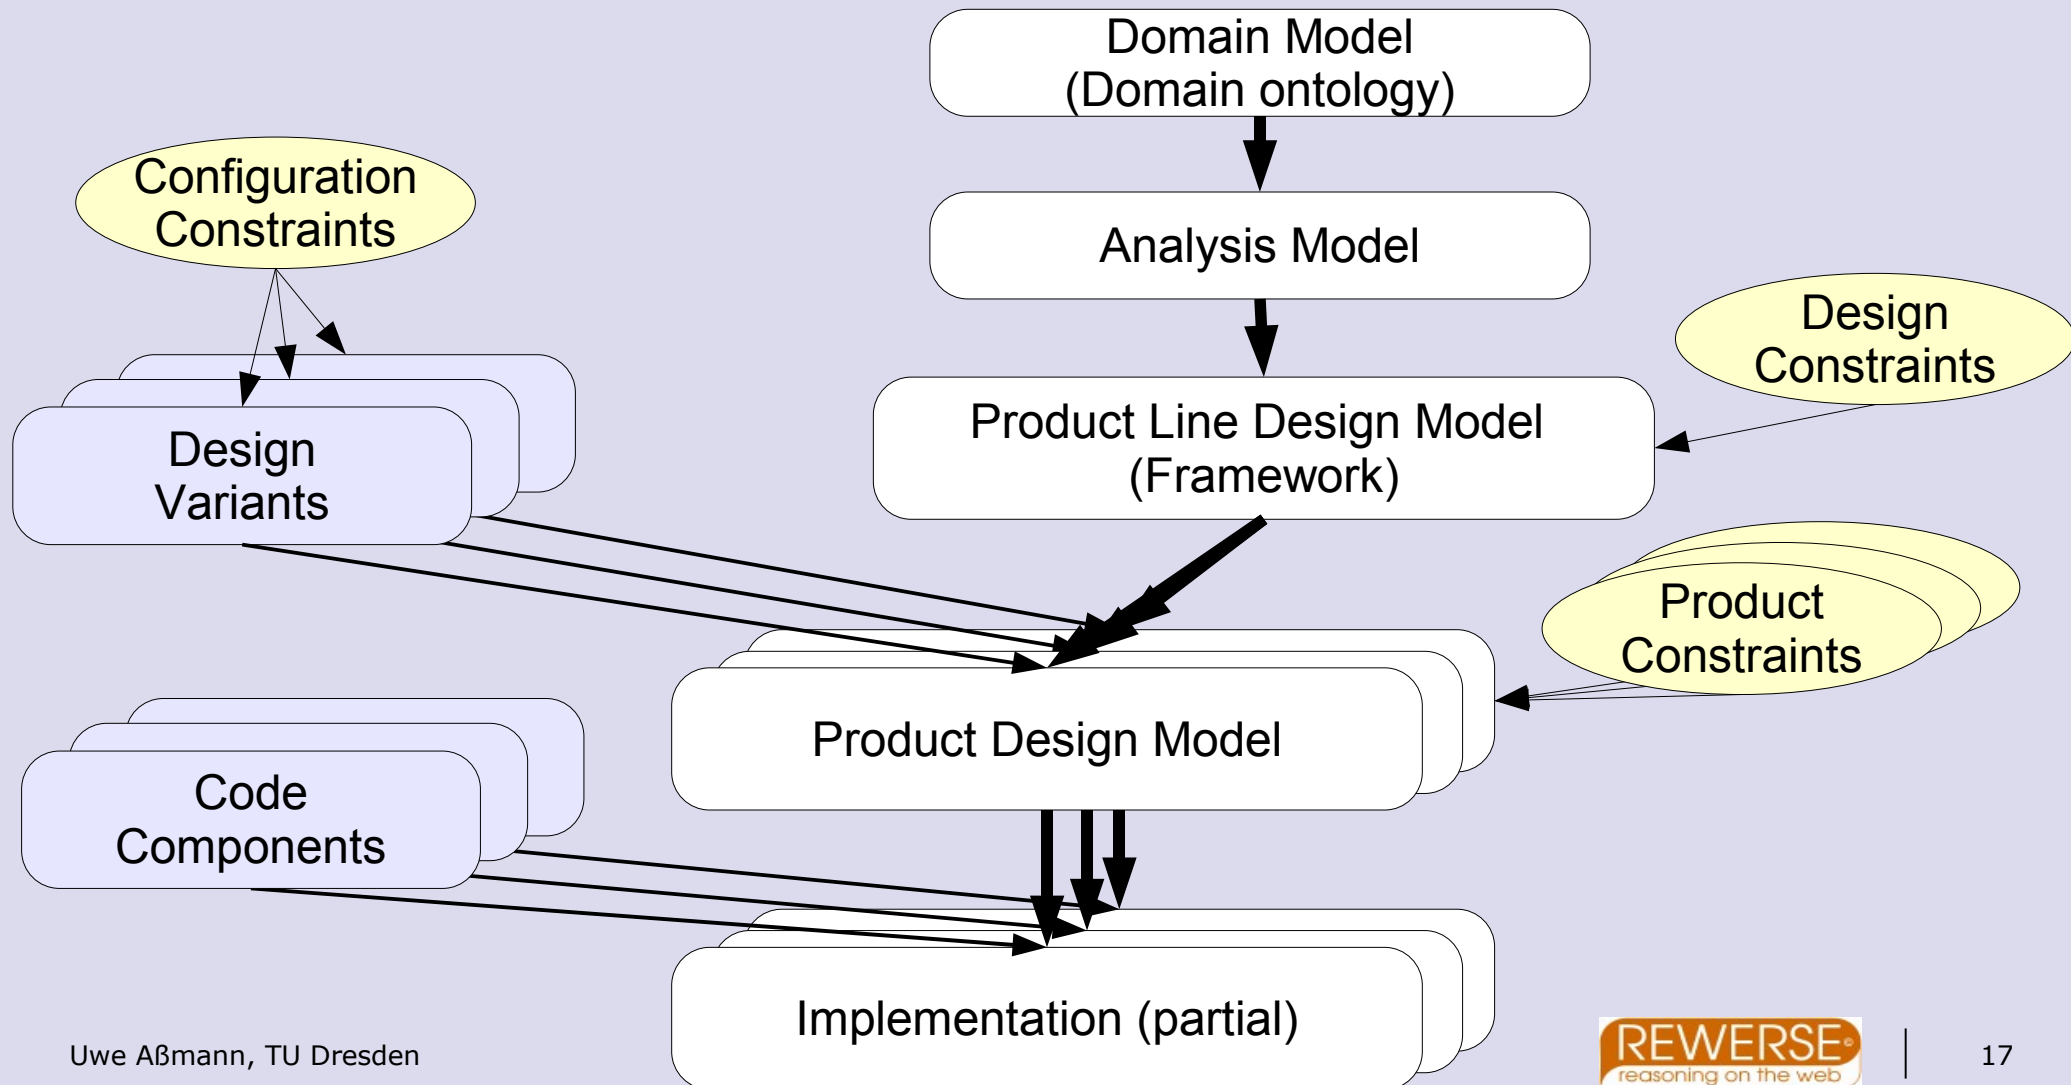

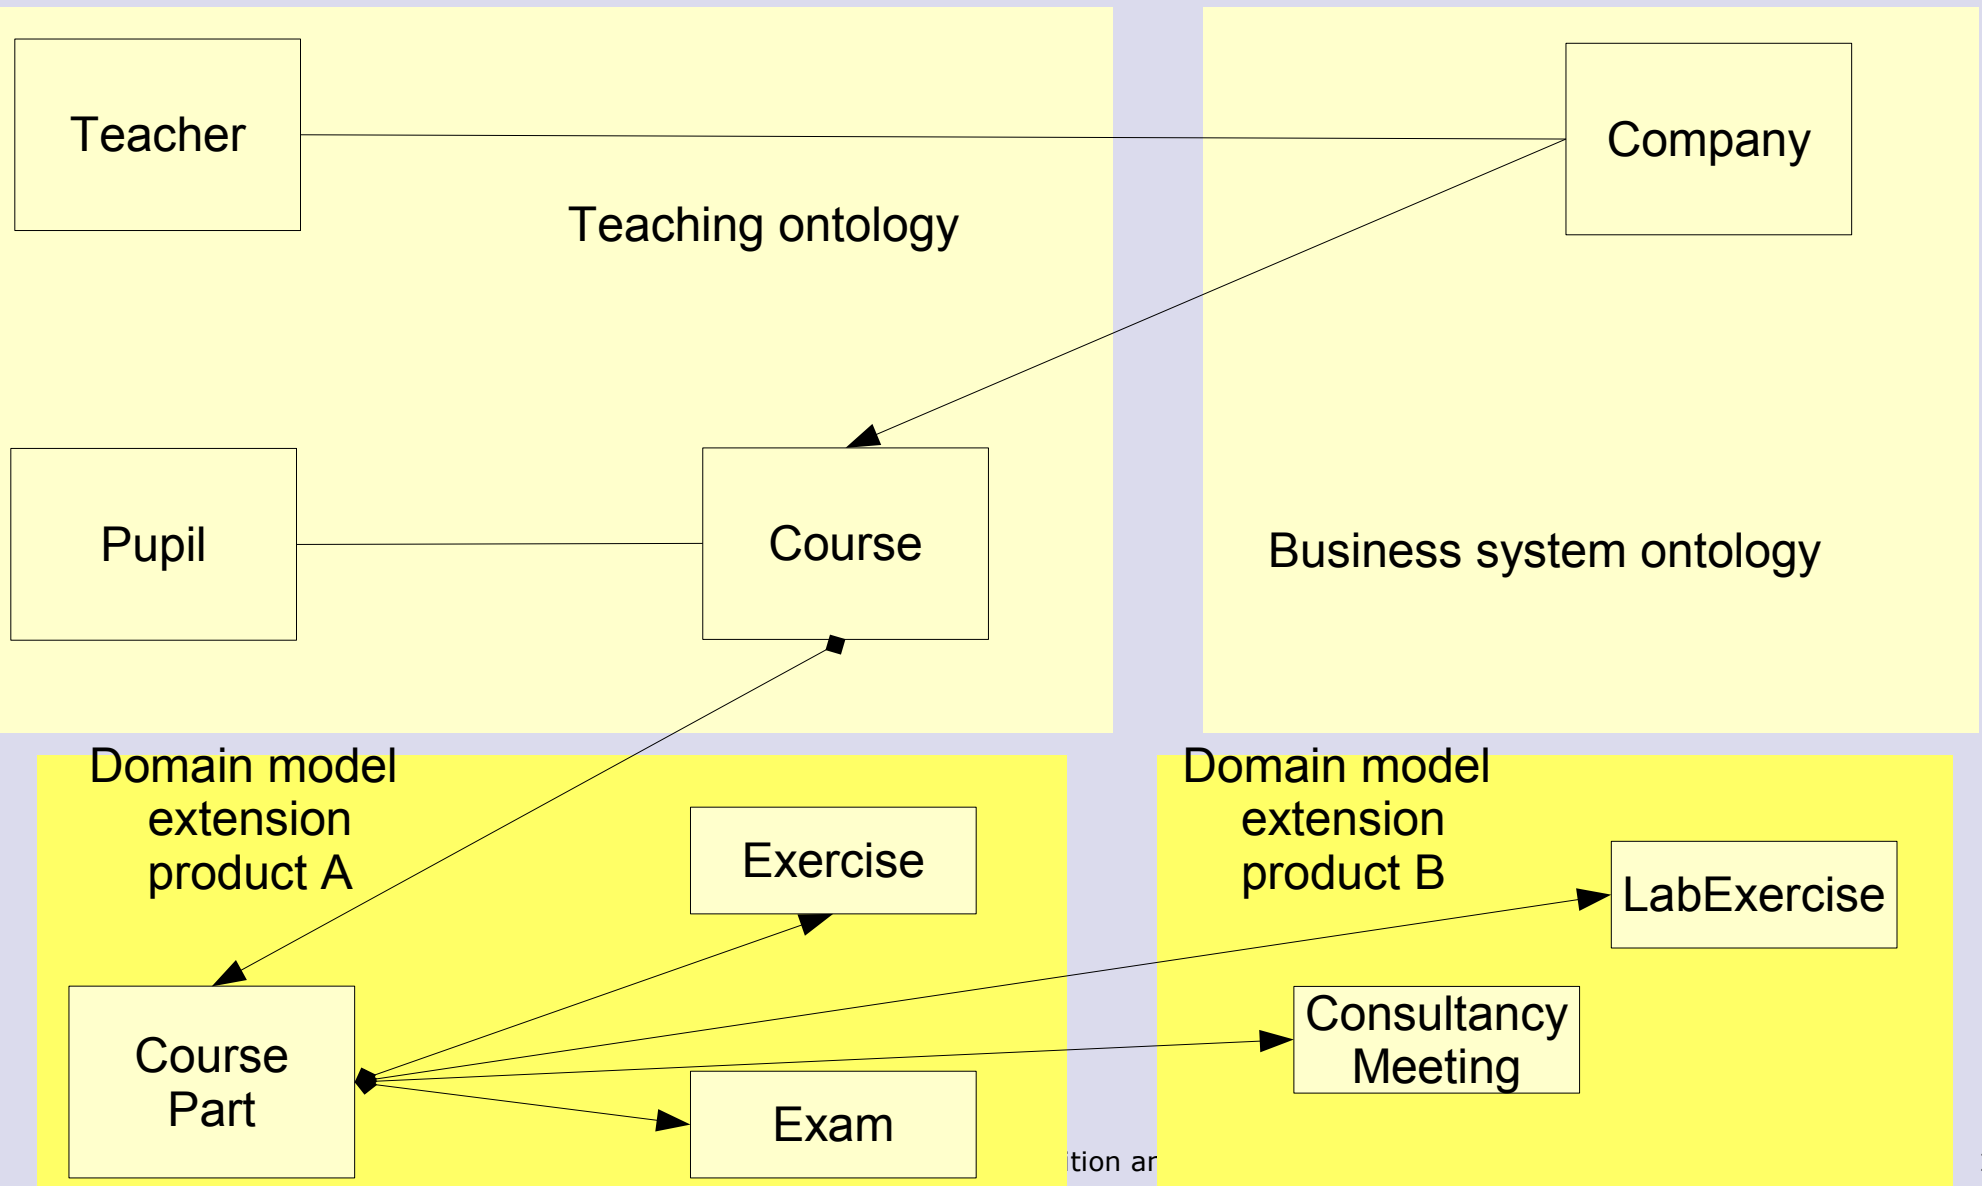

# Tomorrow: Product Line Development with Ontologies

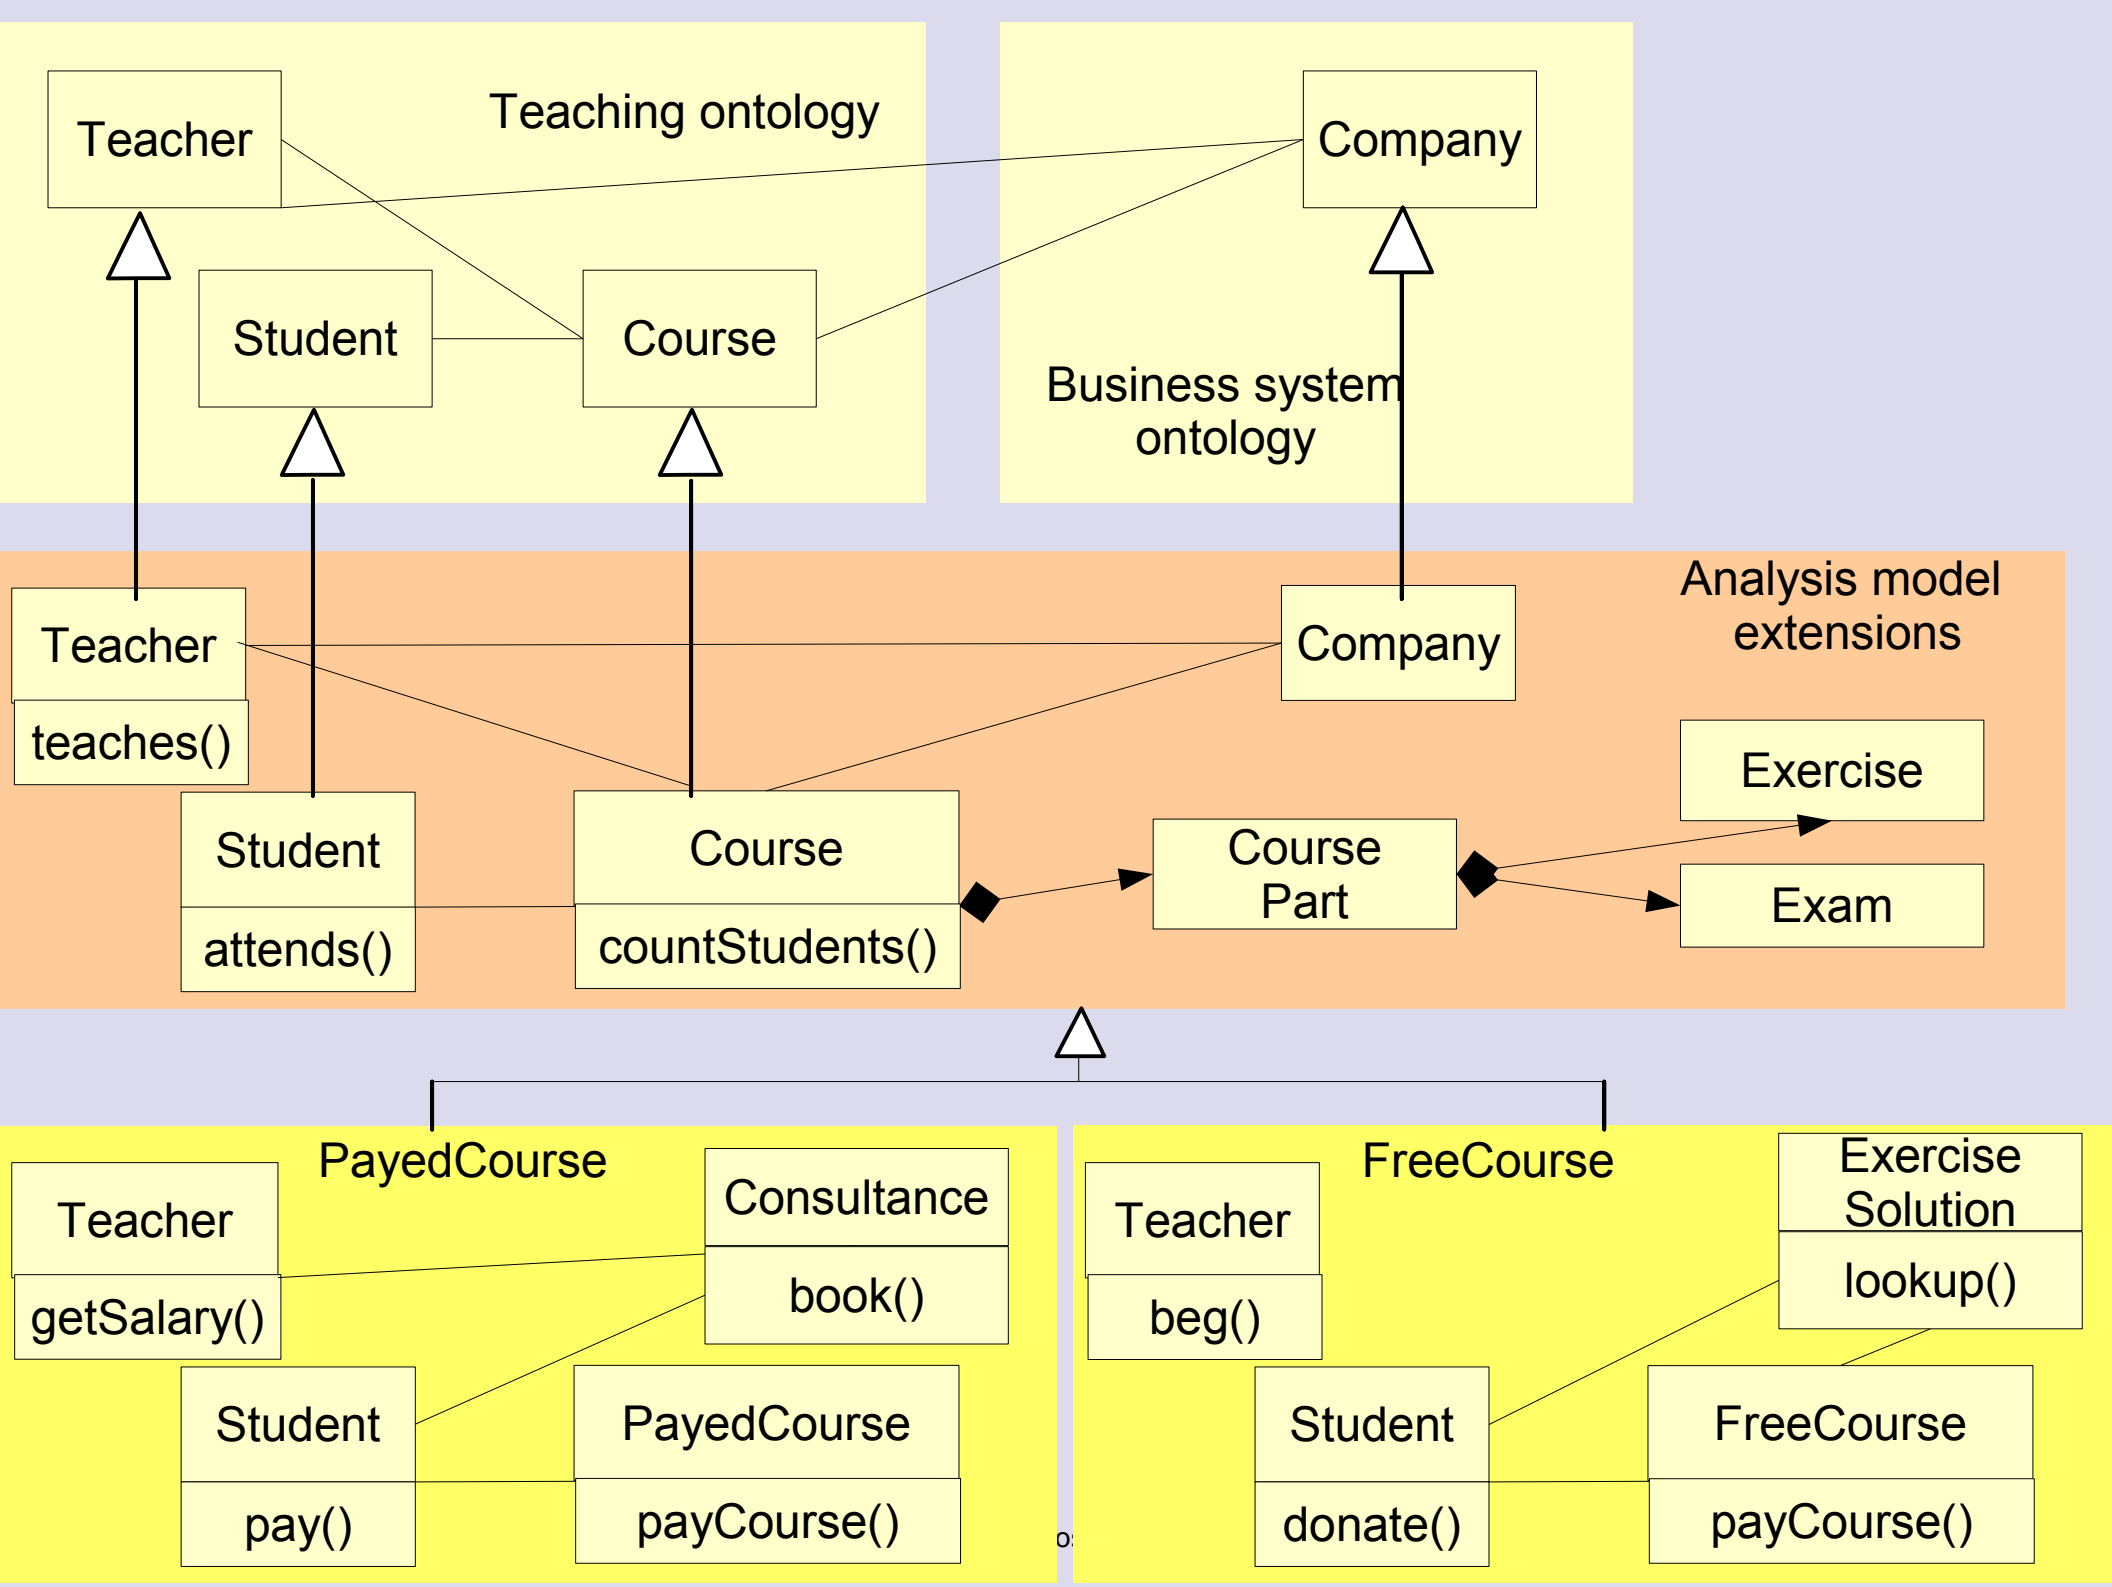

## Ontologies can express the terminology of a product line

- ◇ The domain, design, the configuration, and product constraints

# The Start of a Course Management System Product Line

# Product-Line Development of the Future

**No product line without product line ontologies**

**Product-line ontologies will be declarative, logic-based models of the different aspects of a product line.**

- ◇ Standardized for product line community
  - Users, vendors, OEMs, etc.
- ◇ Big frameworks have thousands of users

# Another Application: Service-oriented Architectures (SOA)

# How to Improve on CORBA

**Better understanding, if types come from standardized ontologies**

# Matchmaking in a SOA

## Ontologies are indispensable for good matchmaking in a SOA

Desired properties                      Provided properties

Client  
Component

# The REWERSE Network of Excellence

... reasoning on the web ...

# The REVERSE Network [www.reverse.net](http://www.reverse.net)

**Develop rule-based languages for reasoning on the web**

## **6<sup>th</sup> framework Network of Excellence**

- ◇ 2003-2007, > 5 Mio Euro
- ◇ Coordinator TU München (Francois Bry)
- ◇ 27 partners

# Working Groups

## 5 technical working groups

- ◇ I1: Rule markup languages (Wagner, Cottbus)
- ◇ I2: Policy specification, composition, and conformance (Bonatti, Naples)
- ◇ I3: Composition and Typing (Aßmann, Dresden)
- ◇ I4: Reasoning-aware querying (Bry, Munich)
- ◇ I5: Evolution and reactivity (Alferes, Lisboa)

## 3 application groups

- ◇ A1: Web-based decision support for event, temporal, geographical data (Ohlbach, Munich)
- ◇ A2: Bioinformatics web (Schröder, Dresden)
- ◇ A3: Personalized information systems (Henze, Hannover)
- ◇ ET: Education and training (Maluszynski, Linköping)
- ◇ TTA: Technology transfer and awareness (Geisler, webXcerpt)

# Some Activities So Far

Xcerpt XML query language (Bry)

Areal reasoning (Ohlbach)

goPubMed.org (Schröder)

Universal Composition for ontologies (Aßmann)

Attempto Controlled English (Fuchs)

Integration of ontologies into the software development process (Aßmann)

TOM XML pattern matching in Java (Kirchner)

Prova (Java plus Prolog) (Schröder)

UML with rules (Wagner)

# Working Group I3: Composition and Typing

## Develop a composition technology for ontologies

- ◇ Based on invasive software composition and type systems described by metamodels
- ◇ Transfer the Java-based technology to ontologies
- ◇ Develop a *universal* ontology composition method for many ontology languages

## Develop a typing technology for web-query languages

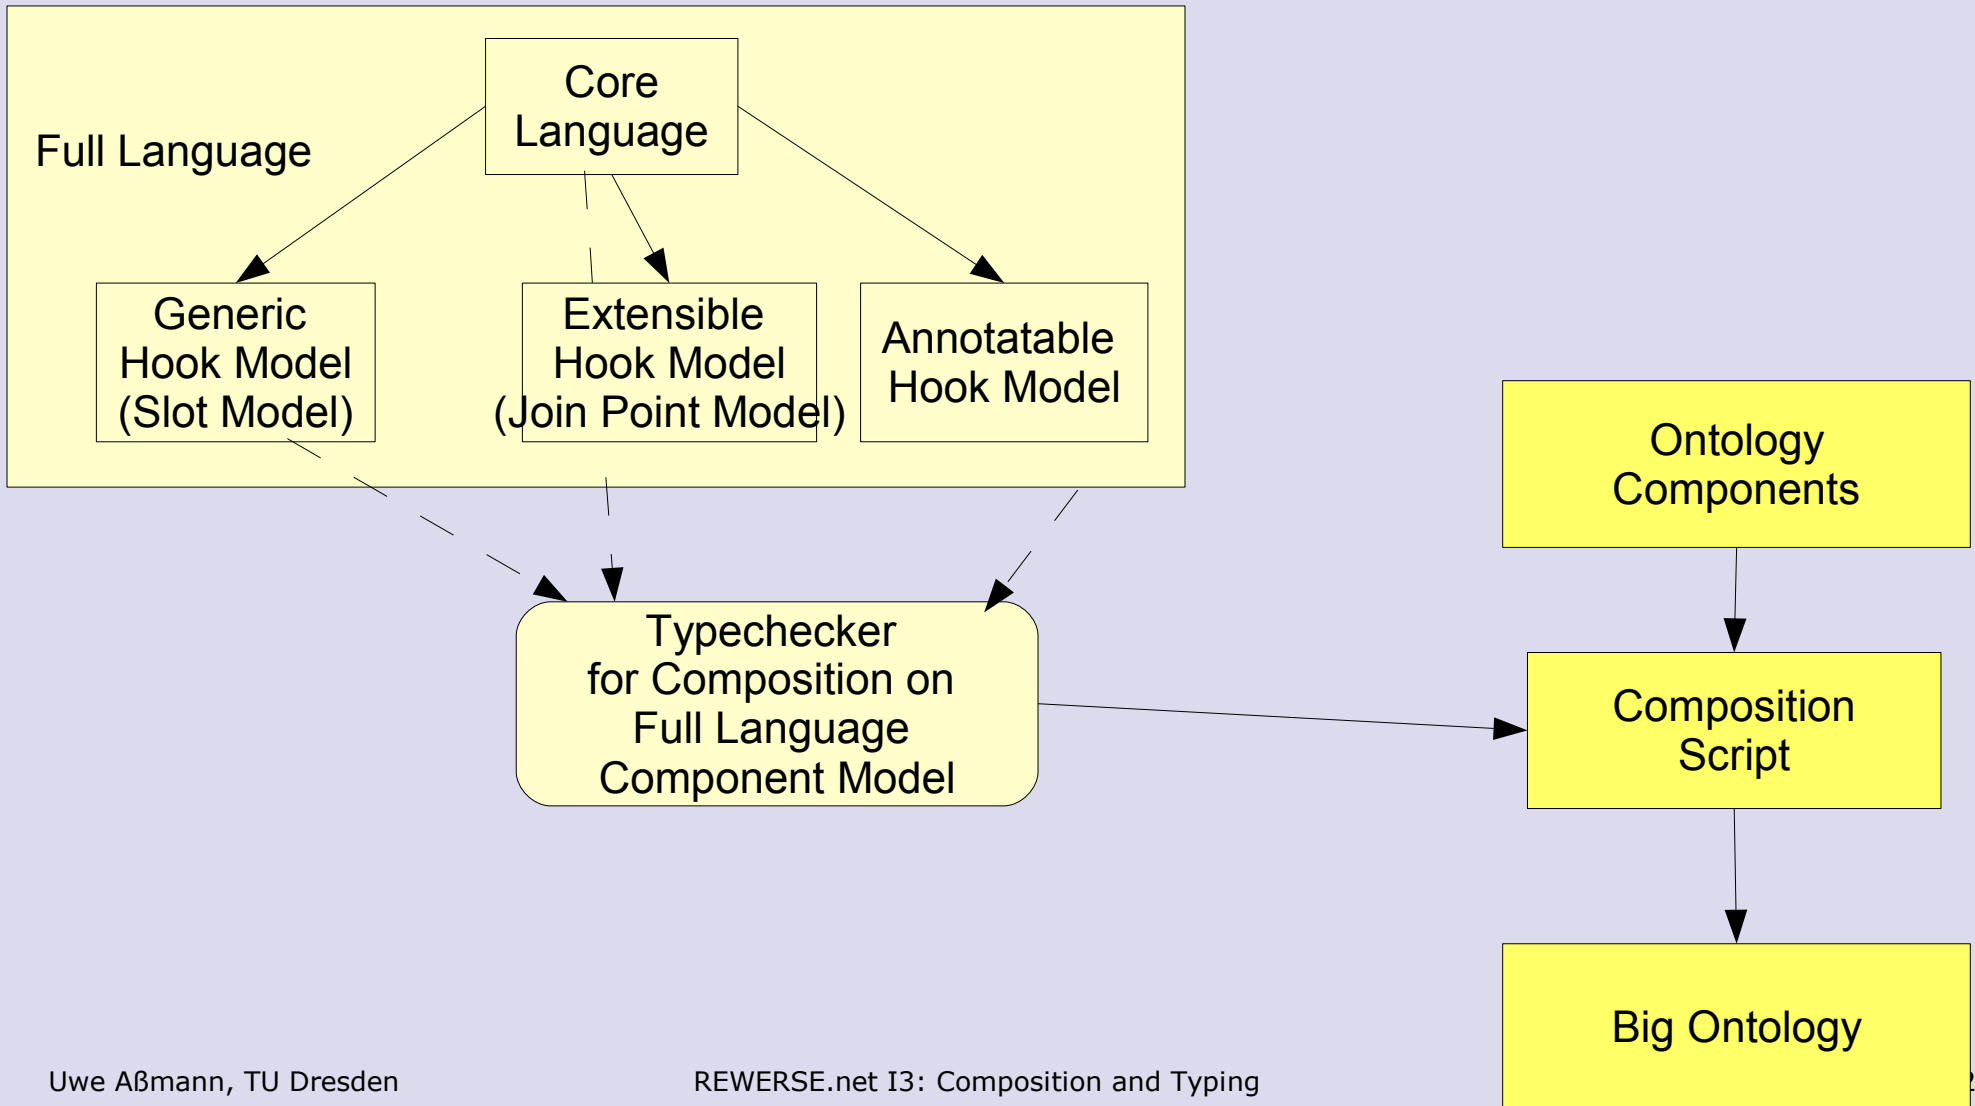

- ◇ Use it for composition of ontologies

## Some Questions:

- ◇ How to master large ontologies (Geneontology.org)?
- ◇ How to reuse ontologies?
- ◇ How to use ontologies in applications?
- ◇ How to use typing technologies to improve

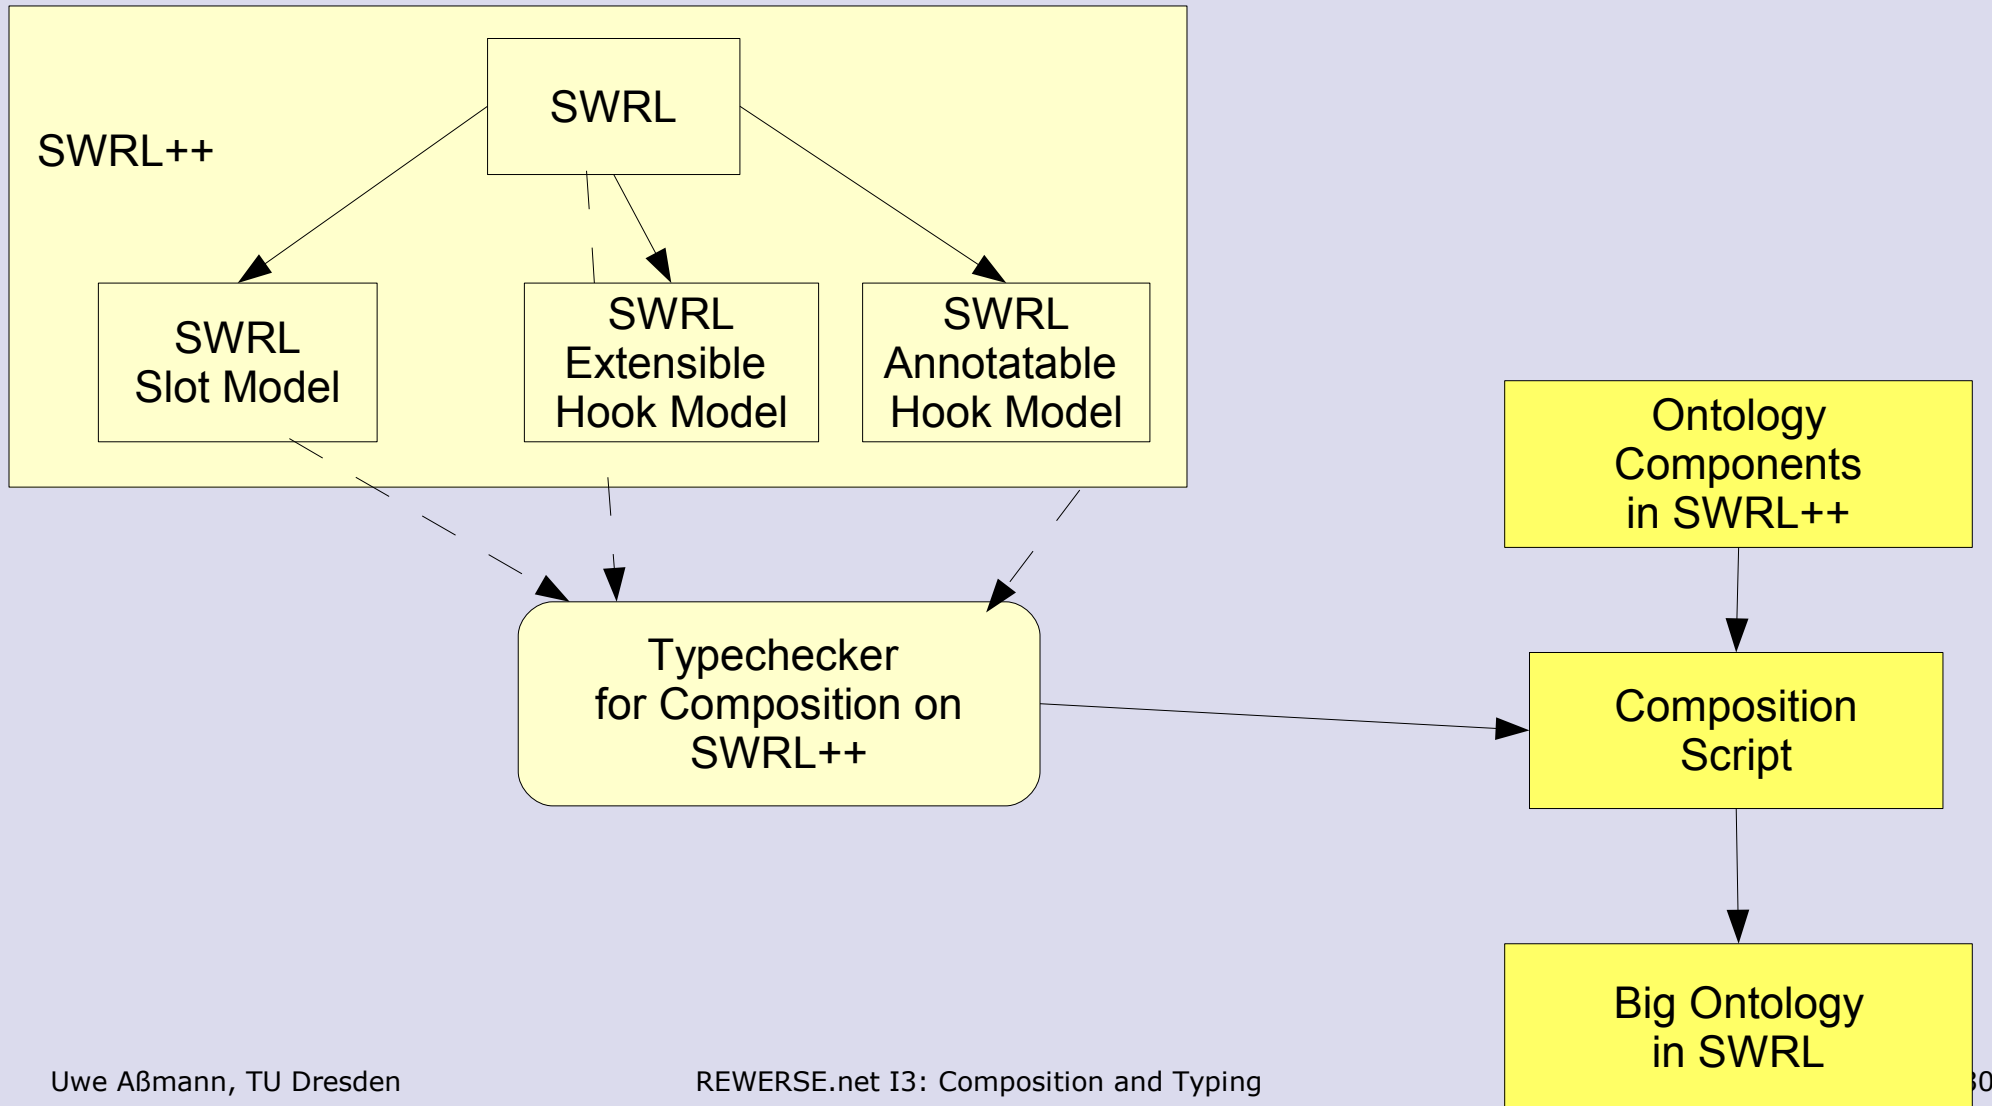

# I3: Derive a Component Model from a Core Ontology Language

**From a core metamodel, derive a component model and type checker for compositions**

# I3: Derive a Component Model for SWRL

**From a core metamodel, derive a component model and type checker for compositions**

# Many More Questions

**How to describe the business model of a big company?**

**How to describe a product line ontology of SAP?**

- ◇ SAP complete bases its software architecture on *semantic services*
- ◇ Many application domains
- ◇ Many specific notions in the framework

**How to build tax ontologies?**

**How to build the ontology of the Porsche 911?**

**How to make tools interoperate with ontologies?**

# Research Questions for Typing Community

## How to compose ontologies of different application domains?

- ◇ Ontology mapping
- ◇ Ontology merging
- ◇ Ontology collaboration

## Treating polymorphism in ontologies

## Developing efficient ontology reasoners

- ◇ How to check the product data of a car manufacturer supplier chain?

## Identifying more decidable subsets of FOL in the spirit of DL and Datalog

- ◇ What lies between DL and Datalog? (DLP)
- ◇ How can the efficient algorithms for set constraints and control flow analysis be taken over to ontology processing?

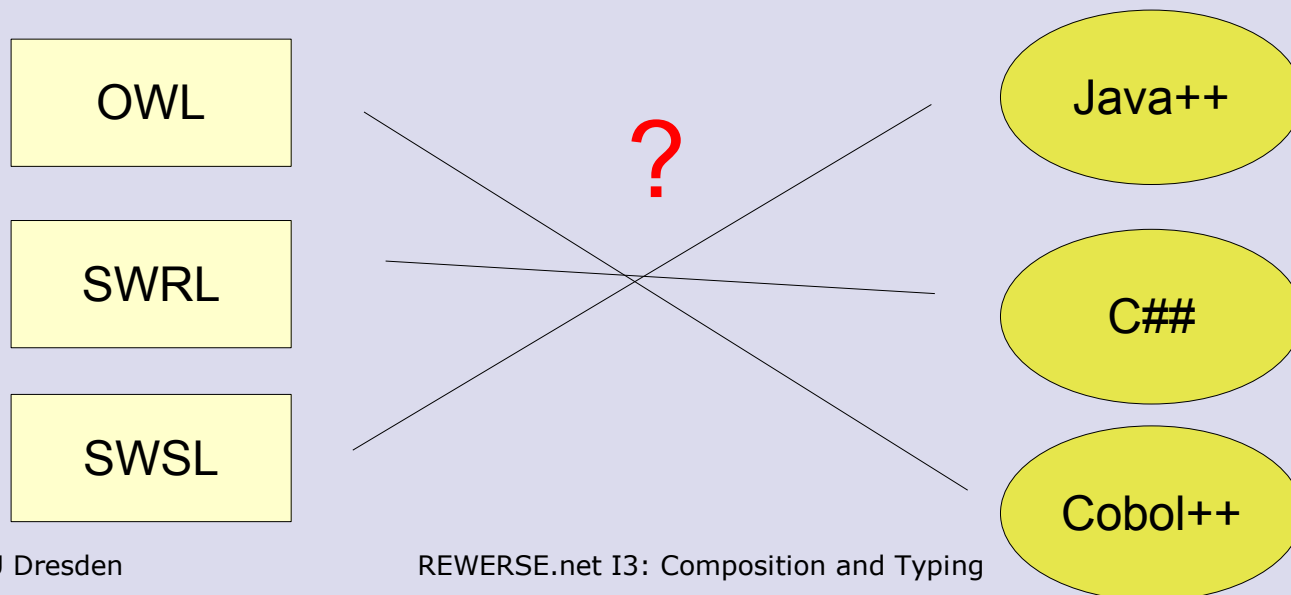

# The Big Question

Every software product has to take in domain ontologies

**Any serious programming language of the future needs to *understand* ontology languages**

- ◇ Compilers and tool chains need to read ontologies

**The typing community and ontology community need each other**

# How to Link This with MDA ?

## **1<sup>st</sup> European Conf on MDA, Foundations and Applications**

- ◇ [www.ecama-fa.org](http://www.ecama-fa.org)
- ◇ Nov 7-10, 2005, Nuremberg

## **UML/Models**

- ◇ <http://www.umlconference.org/>
- ◇ Oct 2-7, 2005, Jamaica

## **PPSWR 2005 Reasoning on the web**

- <http://contraintes.inria.fr/~fages/PPSWR05/>

# REWERSE Summer School in Malta

**July 25-29, 2005**

[www.reasoningweb.org](http://www.reasoningweb.org)

## **Book LNCS 3564**

- Uwe Aßmann. Reuse in semantic applications. In Norbert Eisinger and Jan Maluszynski, editors, Summer School of REWERSE (Reasoning on the Semantic Web), Lecture Notes in Computer Science 3564, July 2005. Springer.

## **Book „Invasive Software Composition“ Springer 2003.**

- Composition of Java fragments.
