

# Application Development for Mobile and Ubiquitous Computing

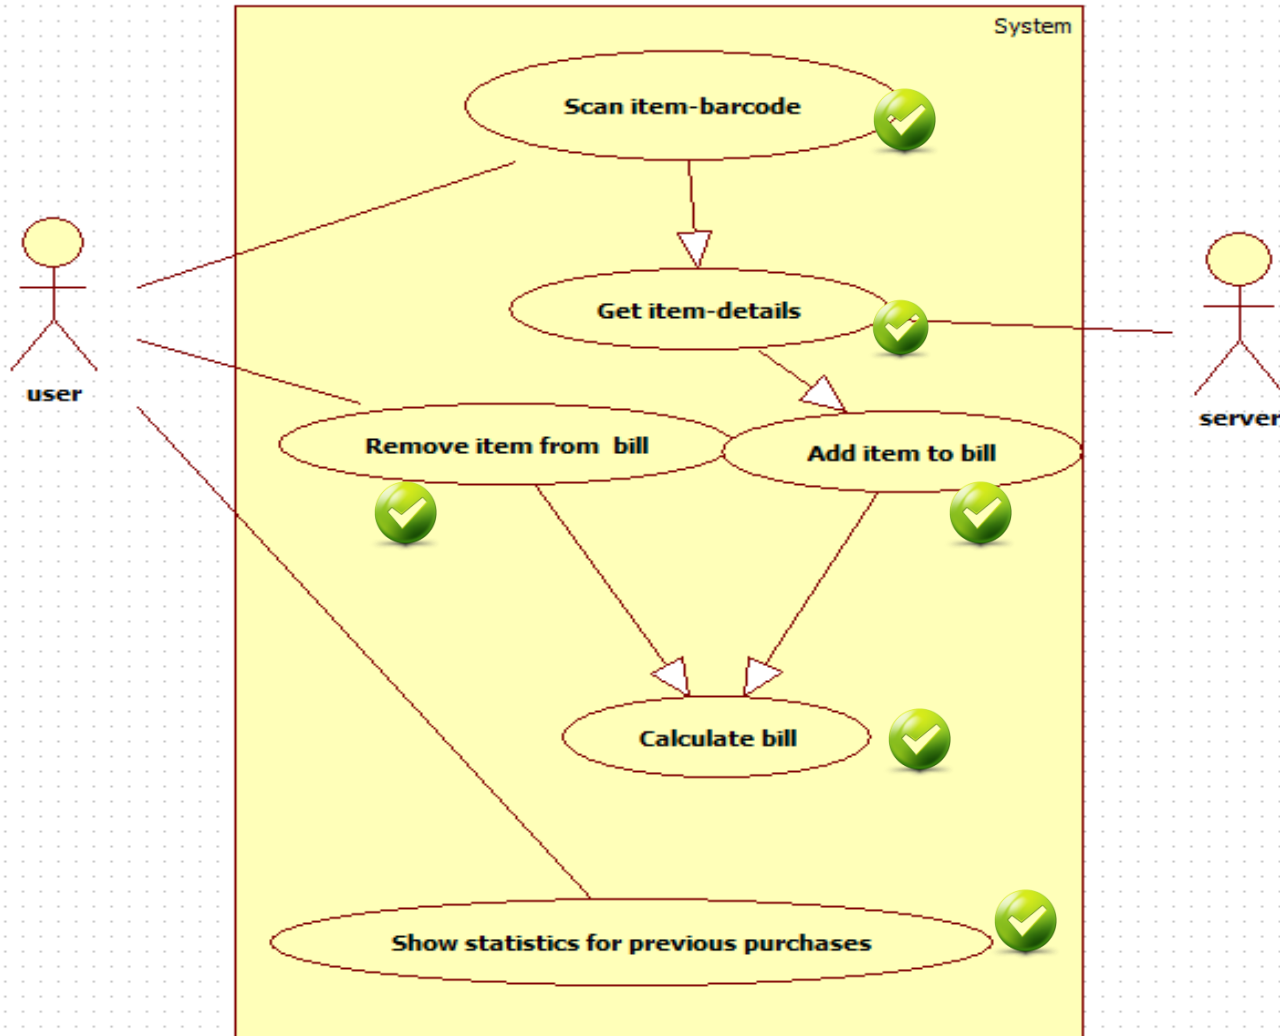

## Seminar Task

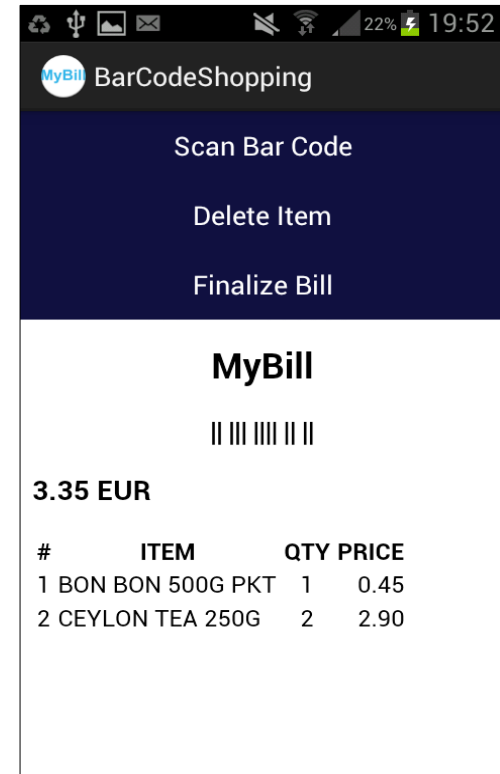

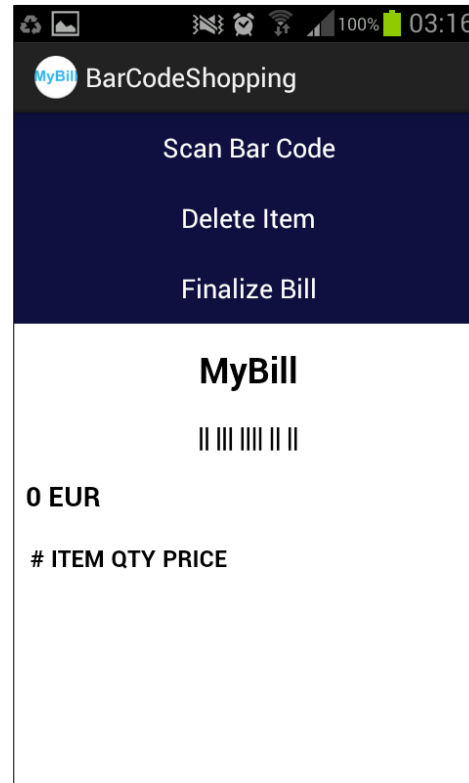

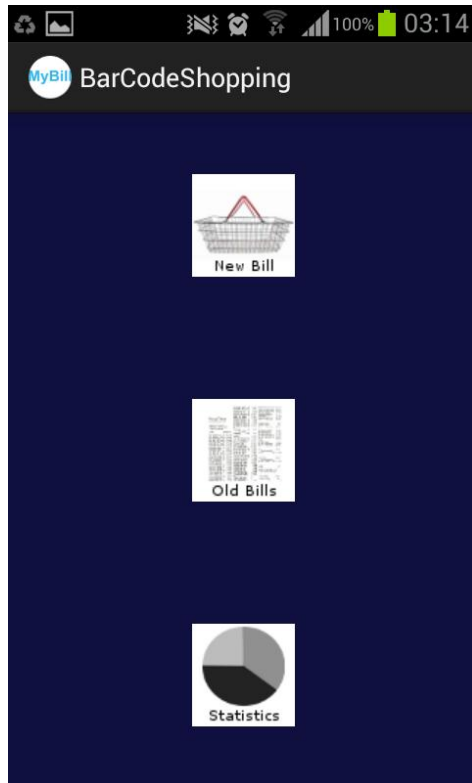

### Supermarket Bill - Final Presentation

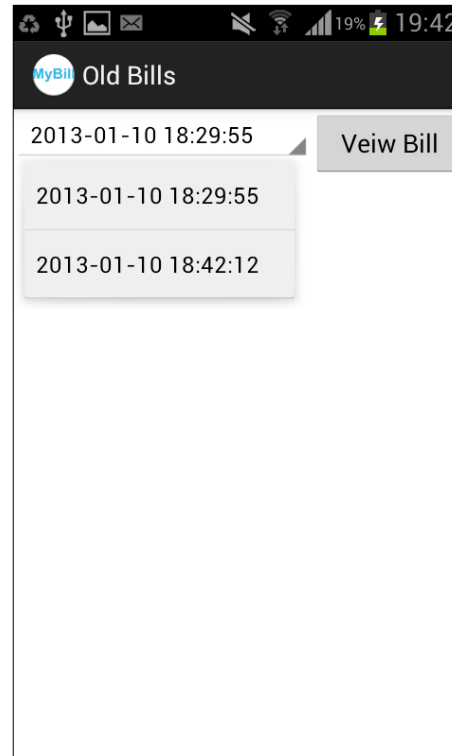

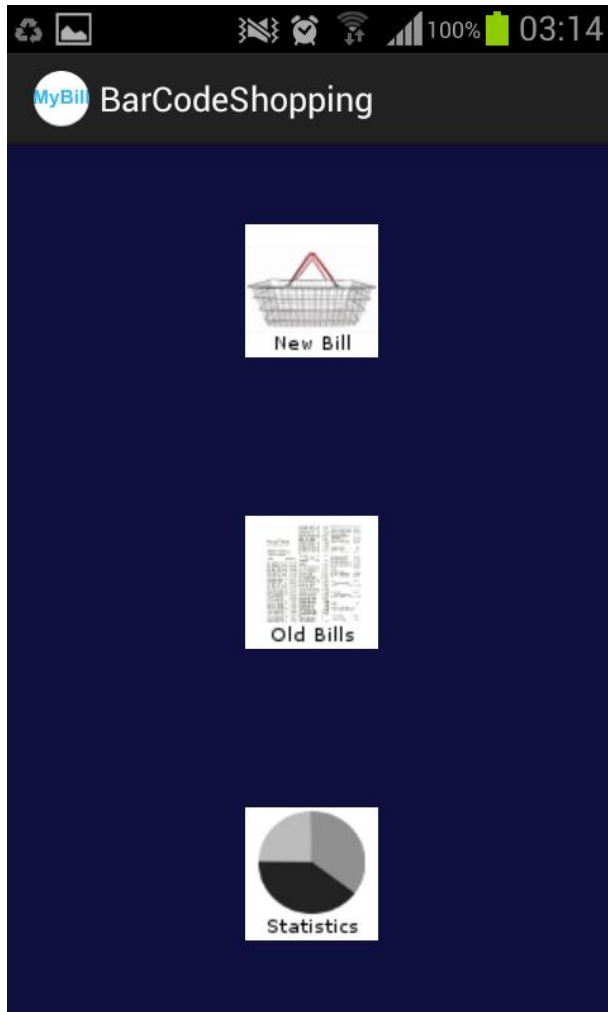

GroupNo. : 2

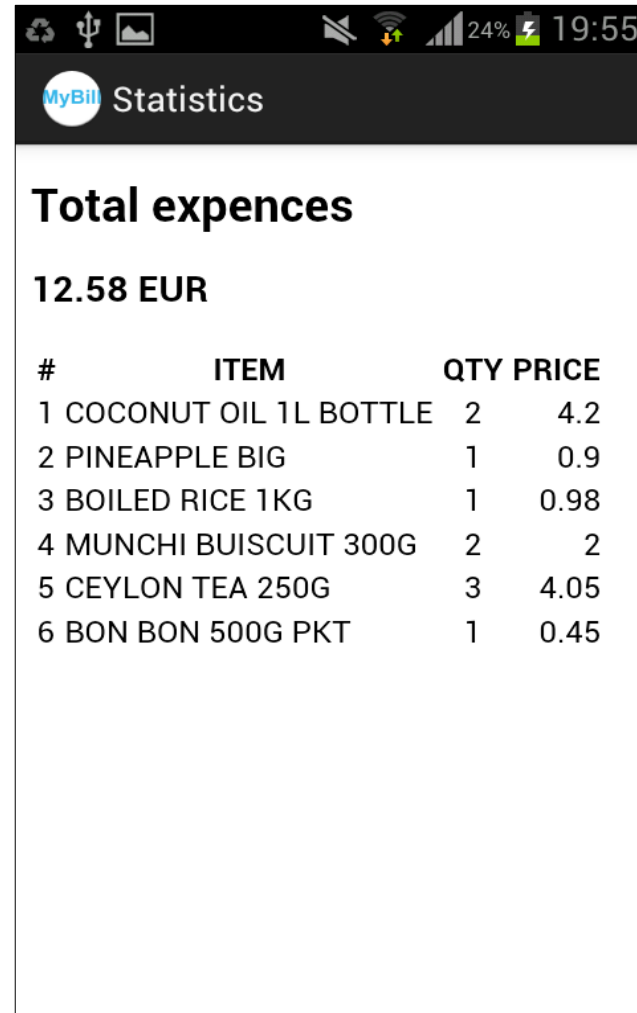

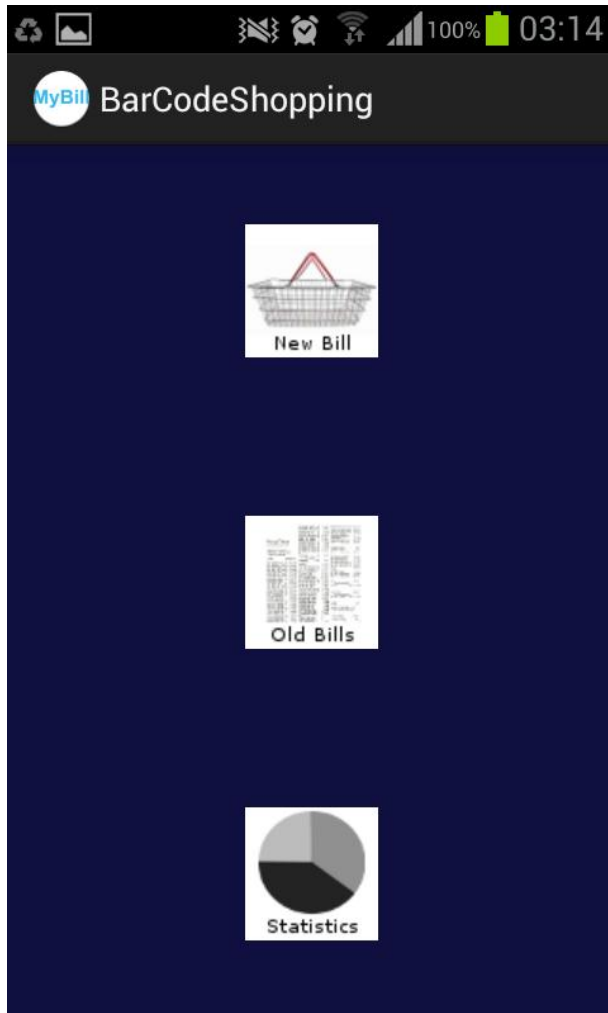

Team: Luiz Alberto de Assis Borges  
Chinthaka Henadeera

- Main issues in mobile computing we had to tackle are
  - Concurrency control at packet losses, packet delays, packet reordering environments. Our implementation is lock free.
  - Simple xml parsing (no standard xml marshalling or unmarshalling method as we deal with a small xml) . We used array based method.
  - Same array based method is used to http error handling.

- There are still trivial known issue in concurrency control of our android client. But practically difficult to experiance for the real world users.
- We experianced an unkown problem with SQLite when dropping databases. We guess this is related to root permission of the android O/S.
- This was our first Android & SQLite experiance. Hence we had to spent long time to learn about the groundwork.
