

Application Development for Mobile and Ubiquitous Computing

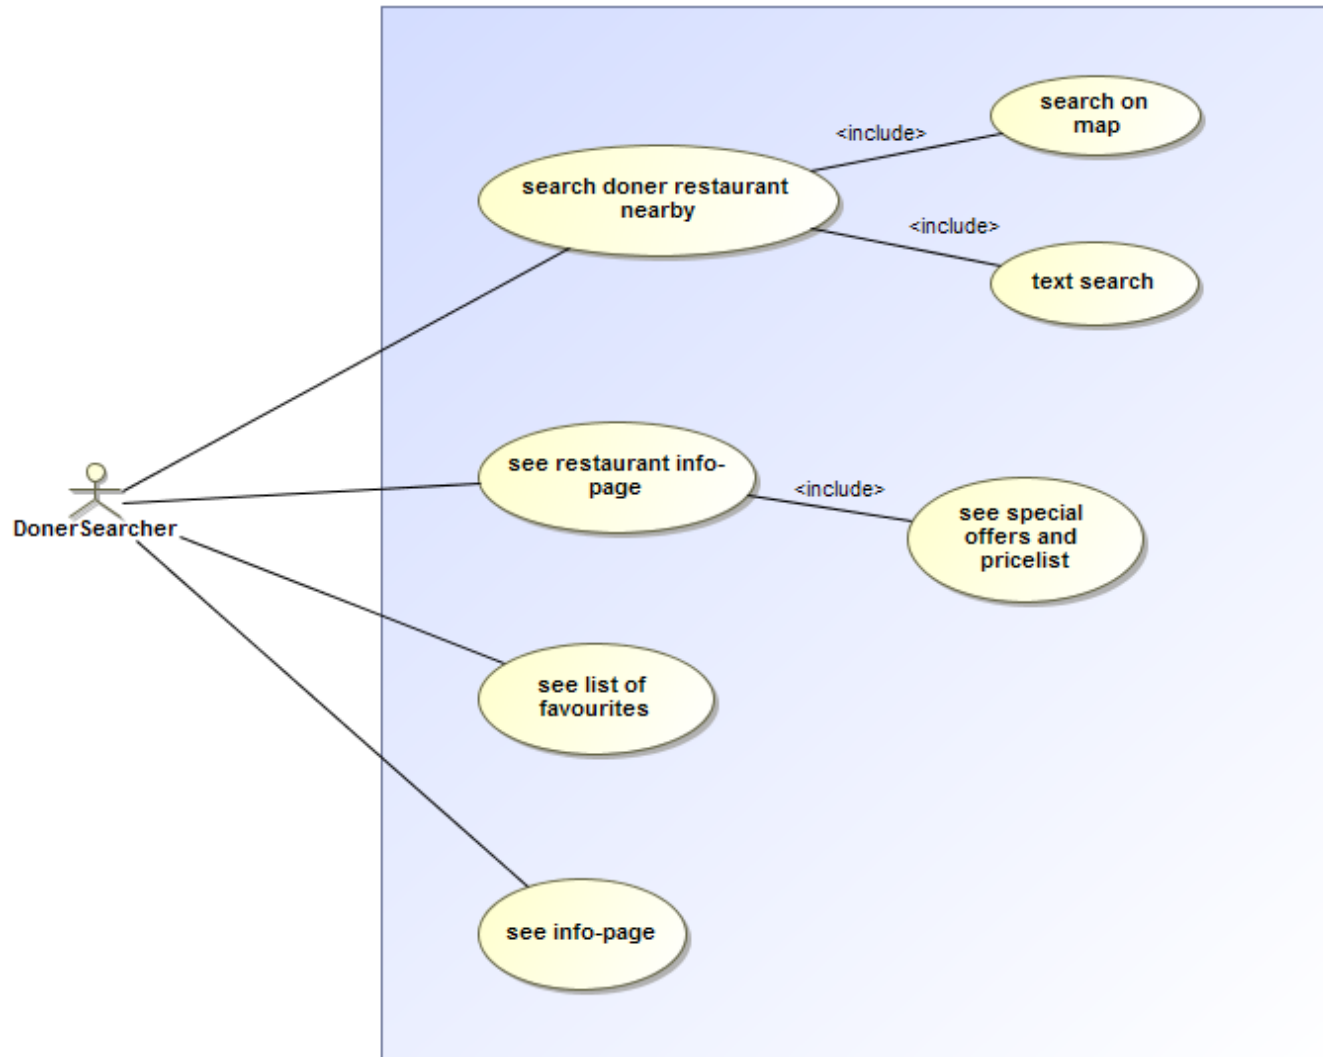

Seminar Task

Second Presentation

GroupNo. 6

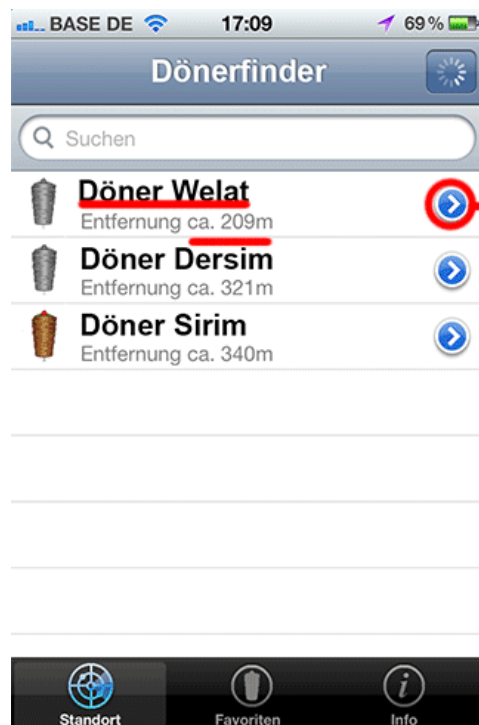

Team: Felix Schwan, Tommy Kubica

1. Concrete Use Cases
2. Detailed Application Scenario
3. Implementation Plan
4. Challenges of Mobile Computing tackled
5. Status Quo
6. Next Steps

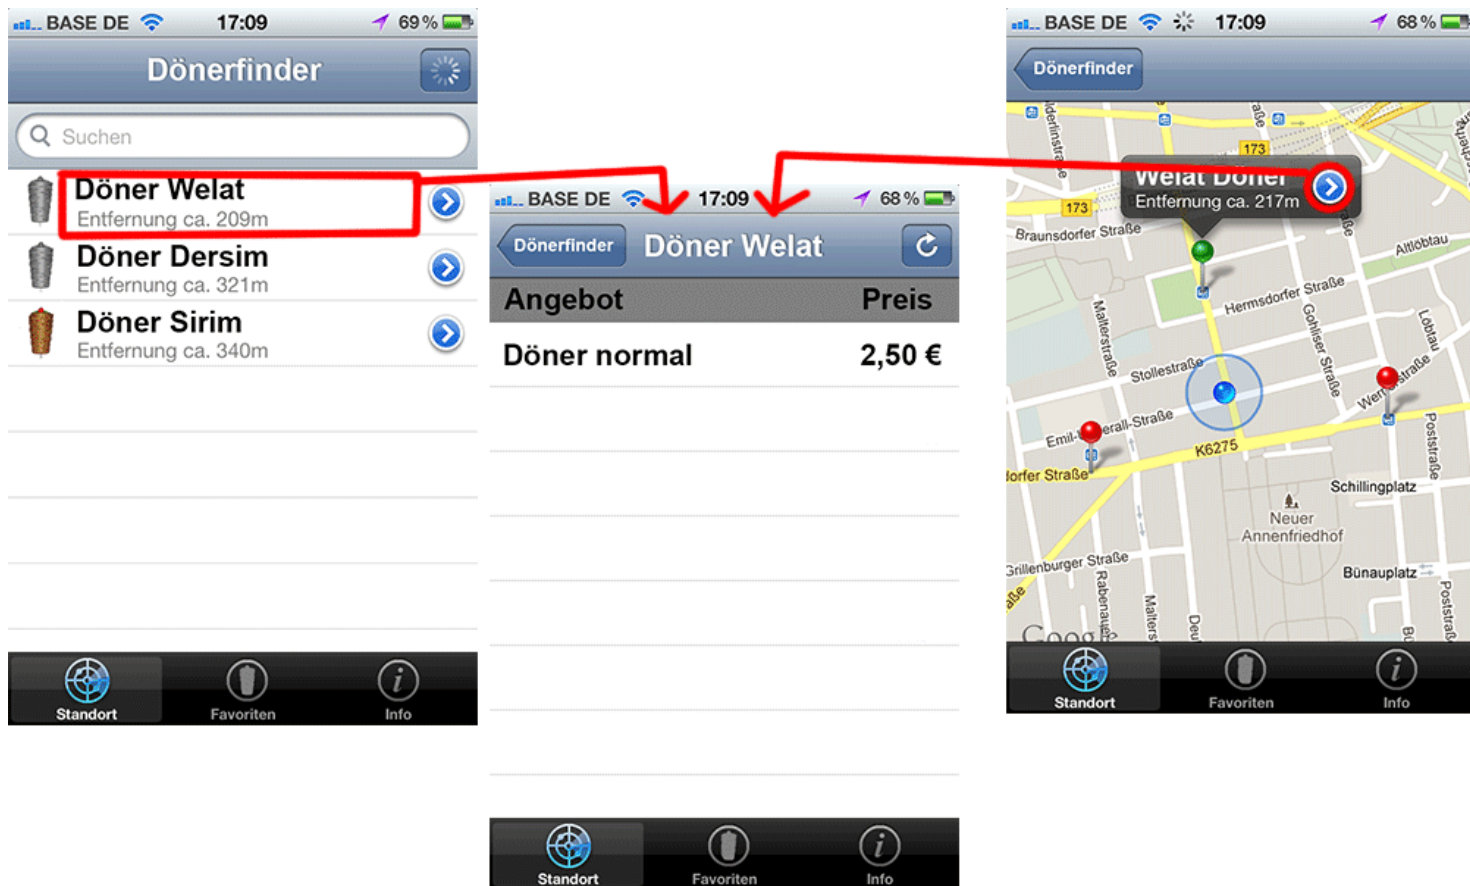

2. Detailed Application Scenario

- User stands at a certain place anywhere and wants to know
 - if there are doner restaurants nearby
 - the location of these

2. Detailed Application Scenario

- He wants to see the pricelist of the nearest restaurant

2. Detailed Application Scenario

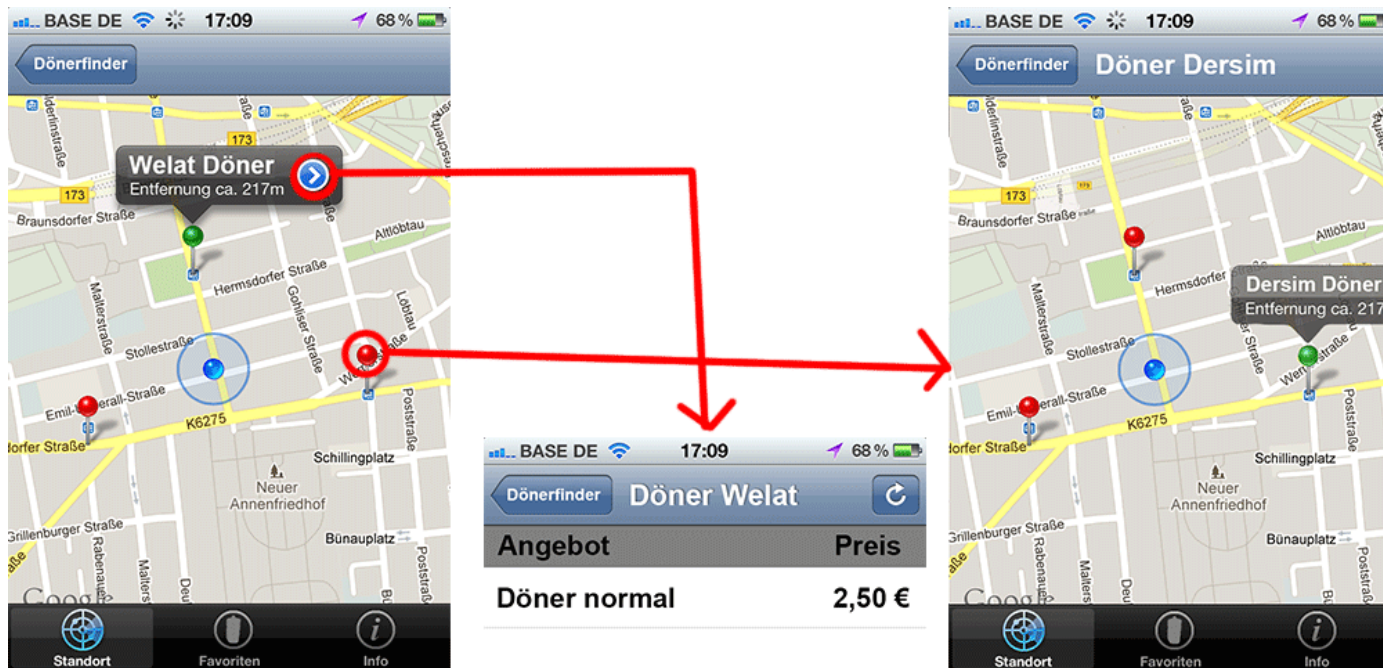

- Now he'd like to know the way to reach the restaurant

2. Detailed Application Scenario

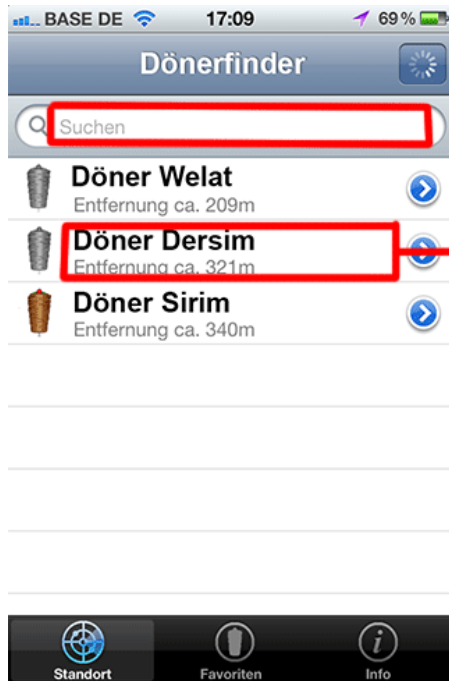

- Finally he decides to search another restaurant nearby
→ 2 different ways

- Finally he decides to search another restaurant nearby
→ 1st way

2. Detailed Application Scenario

- Finally he decides to search another restaurant nearby
→ 2nd way

OR

- Created a webservice with json-file containing our relevant information
 - Reason: there is no uniform website containing all information needed
 - Advantage: basis for building other apps on other devices (e.g. Win8)
 - Maybe interface for changing
- Simple modification/extension via XML/json
- Information is loaded by app from website
- Create a template for the app (map-view, table-view)
- Include loaded information into template
- We want to save the information on devices
 - possibility to work offline

▪ **Usability**

- use conventional UI elements and patterns (tab view, list view) → intuitive handling
- simple navigation between pages
- Information loaded via website

▪ **Navigation**

- determine user's location
- user movement during operations
- map is freely scalable (need to use new iOS6-maps)

- Created a webspace with json-file containing our relevant information ✓
 - Maybe interface for changing
- Information is loaded by app from json-file ✓
- Create a template for the app
 - map-view
 - table-view ✓
- Include loaded information into template

- Test prototype on real device
 - Reason: „Virtual Box“ doesn't get the map-view right
- Include loaded data in the map
- Implement favourites-system
- Connect all features → smooth workflow
- Testing, testing, testing... 😊

Thanks for your attention!
