

Application Development for Mobile and Ubiquitous Computing

Seminar Task

Final Presentation

GroupNo. 11

Team: Twist (Florian Schmidt & Max Kattner)

The Problem: Without Twist

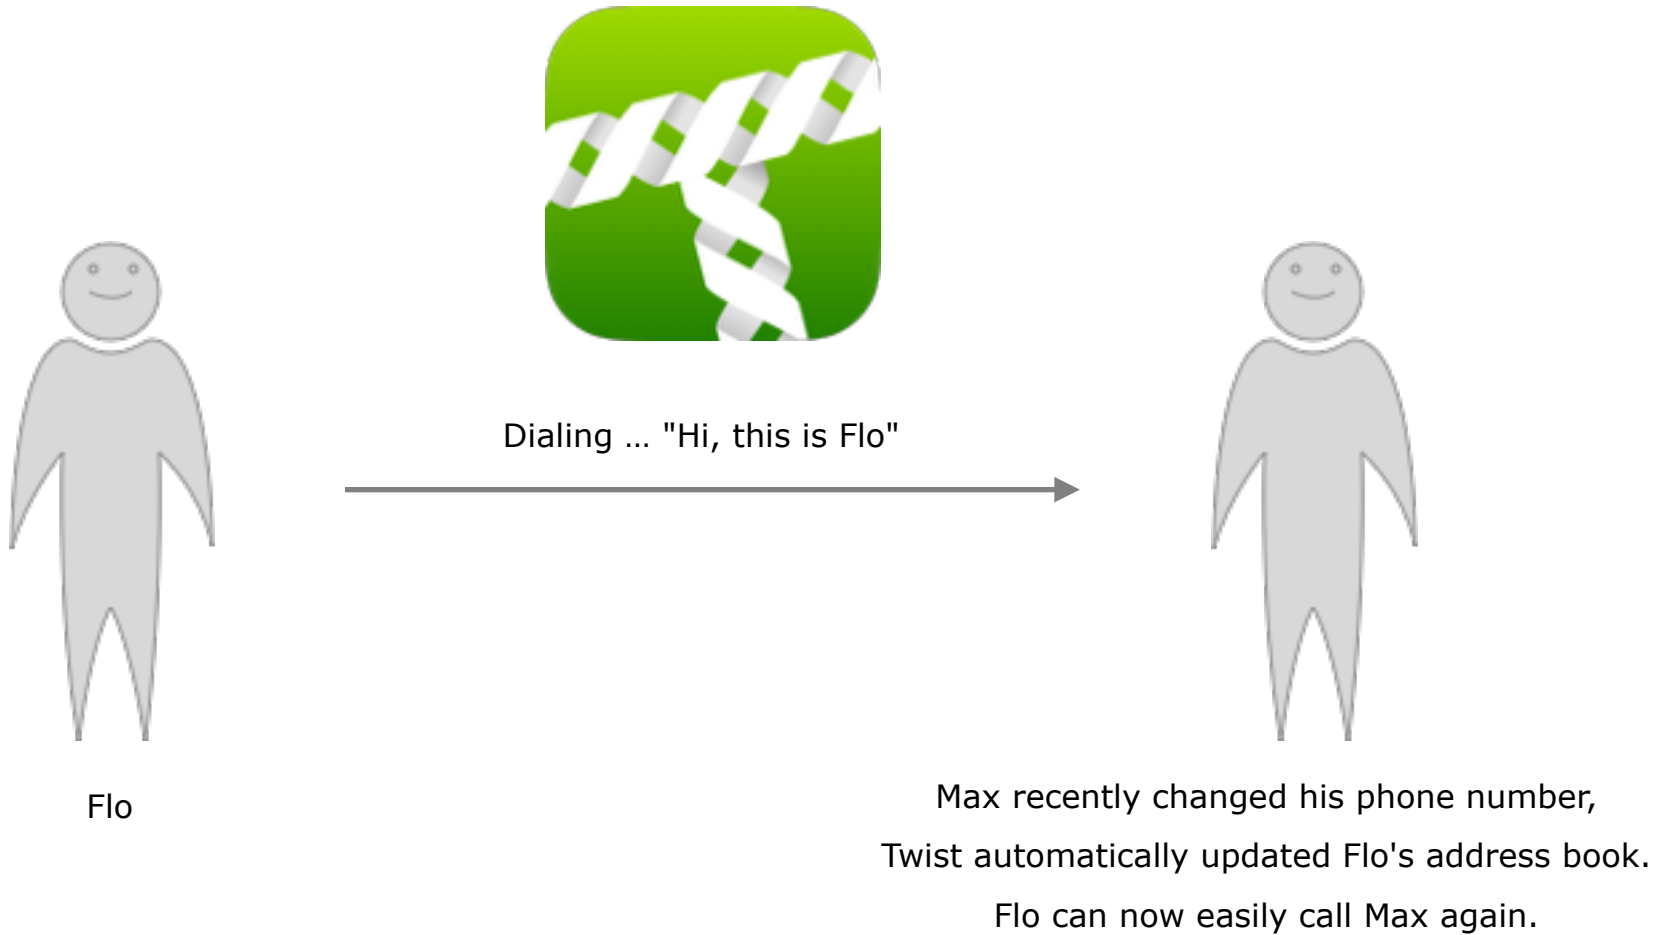

Flo

The number you've called is currently not available

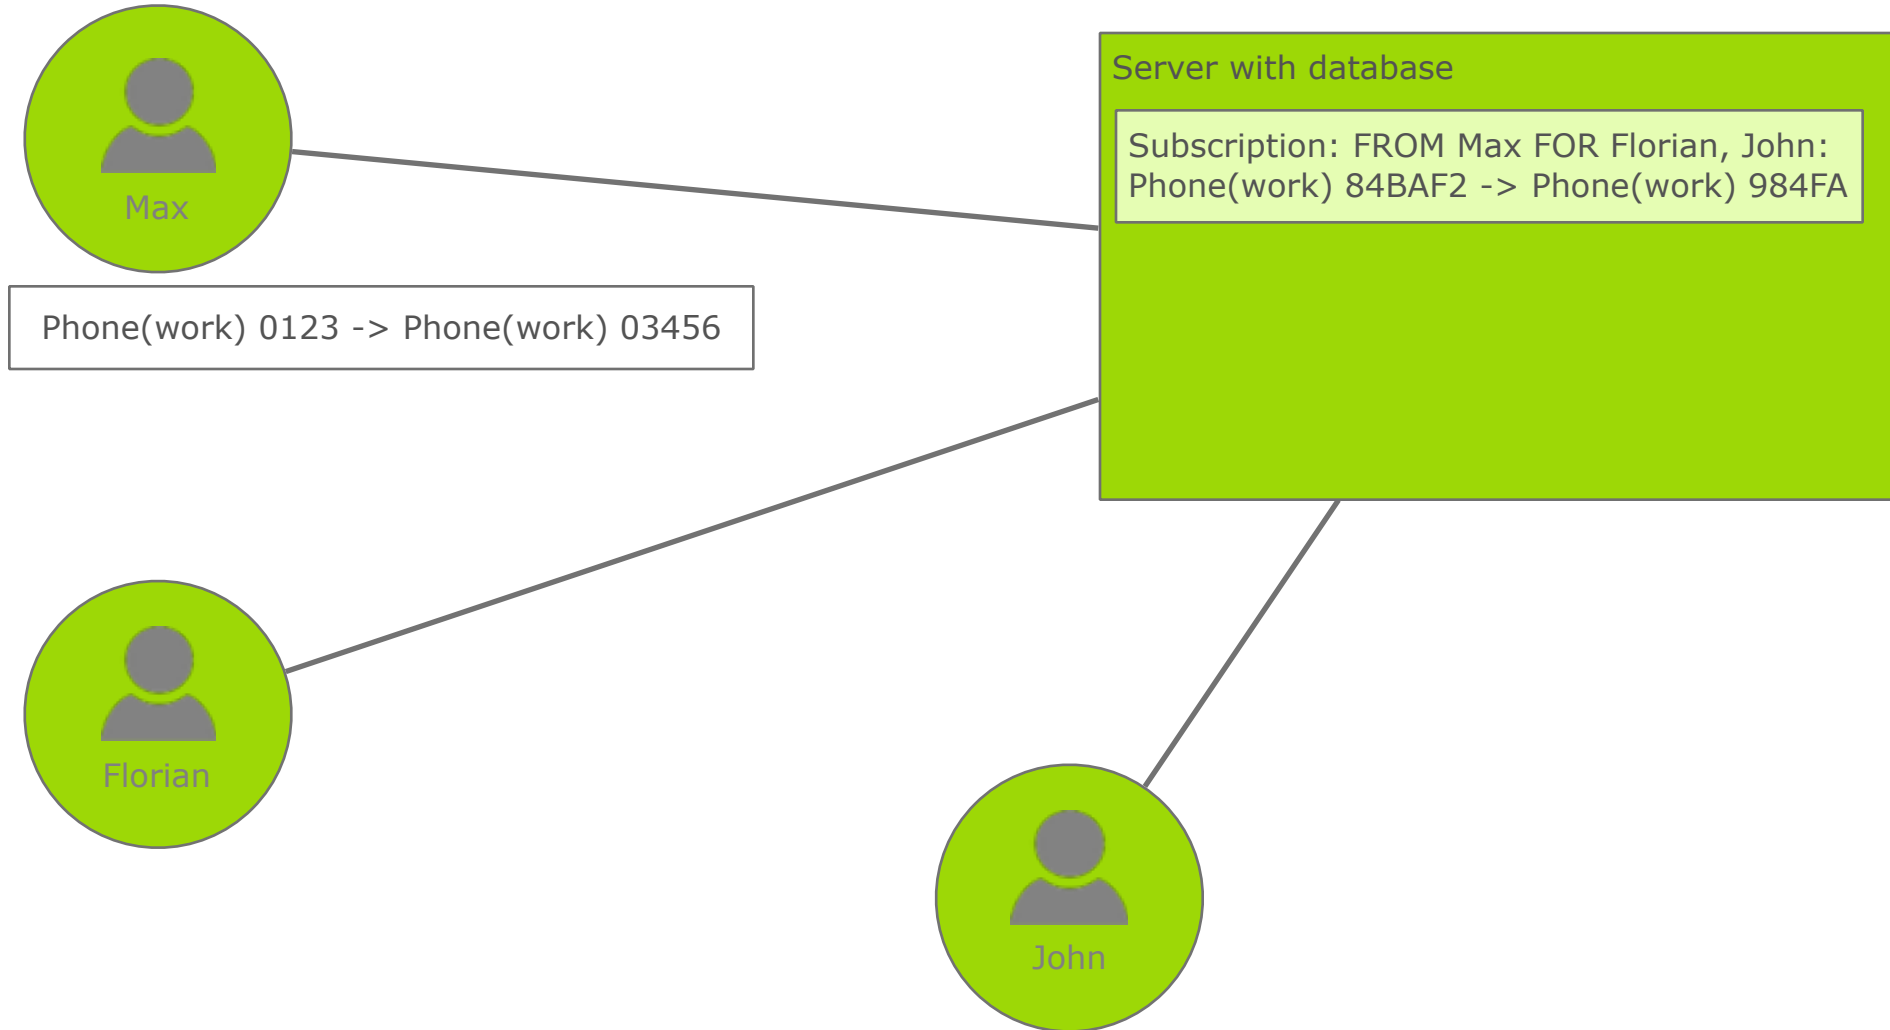

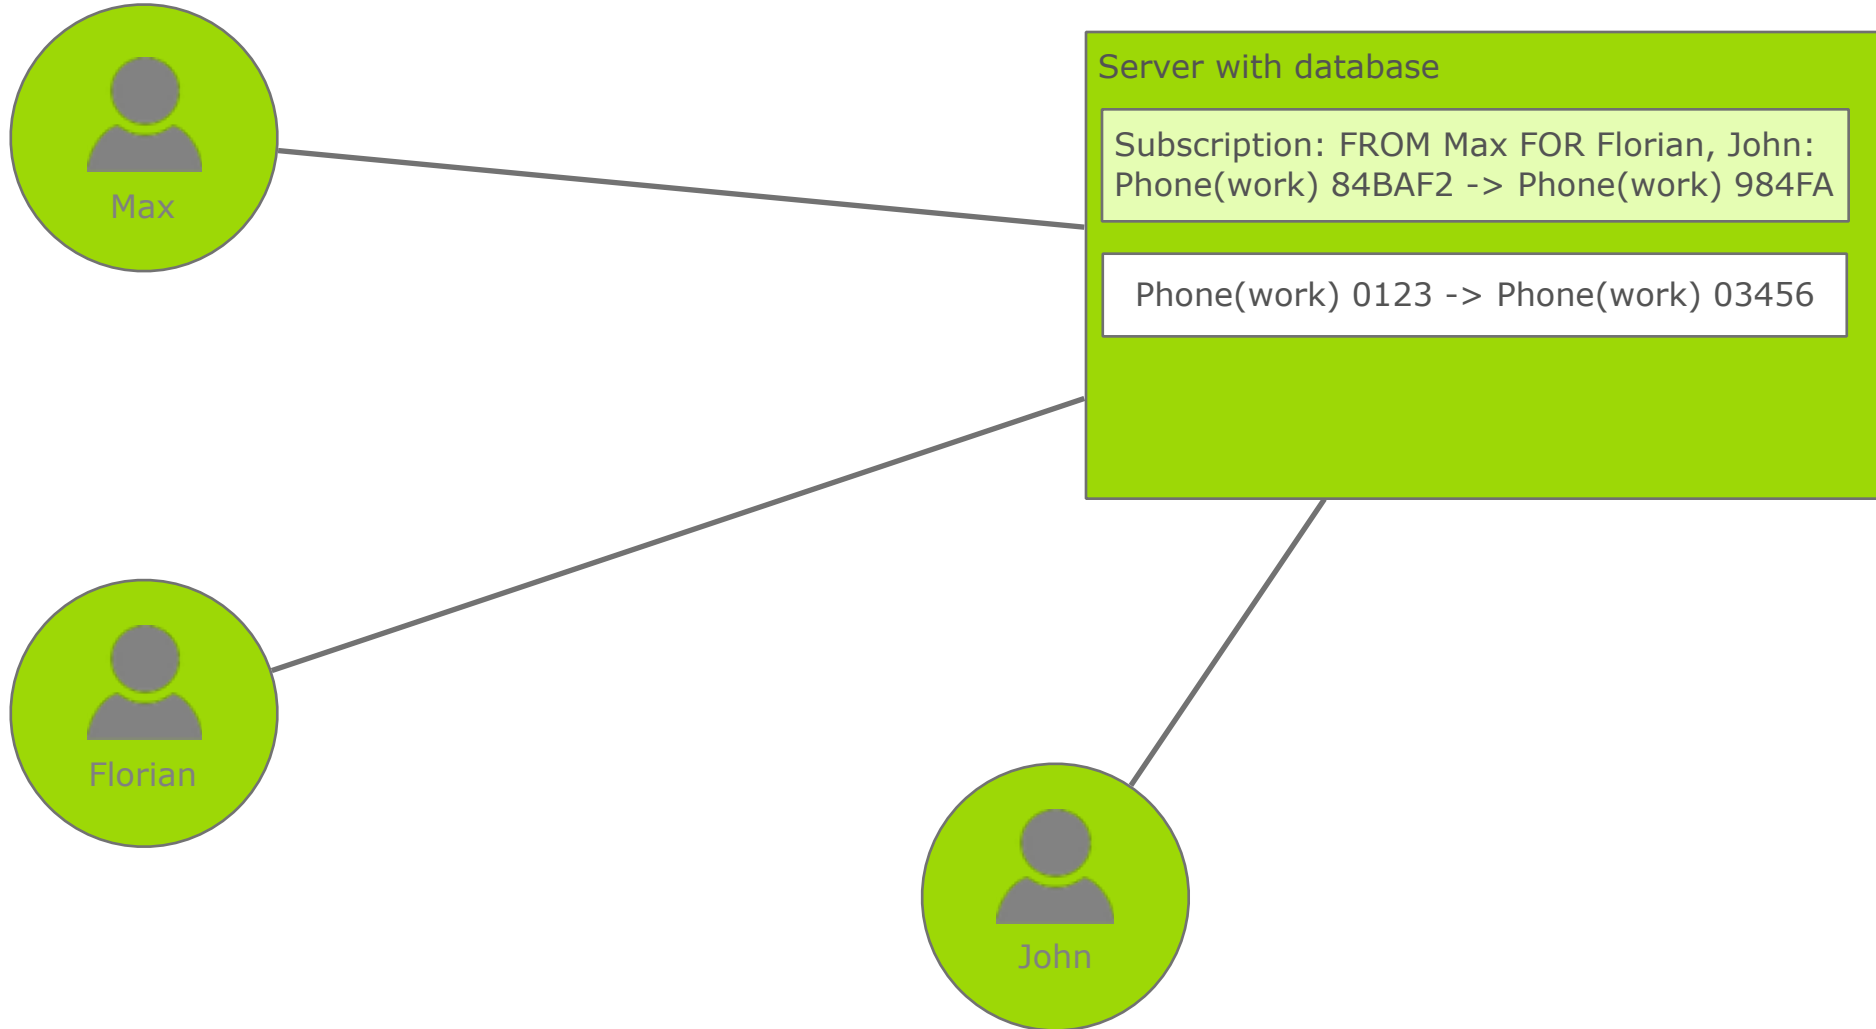

Max recently changed his phone number,
but he didn't tell his friend Flo.
Now Flo can't reach him anymore.

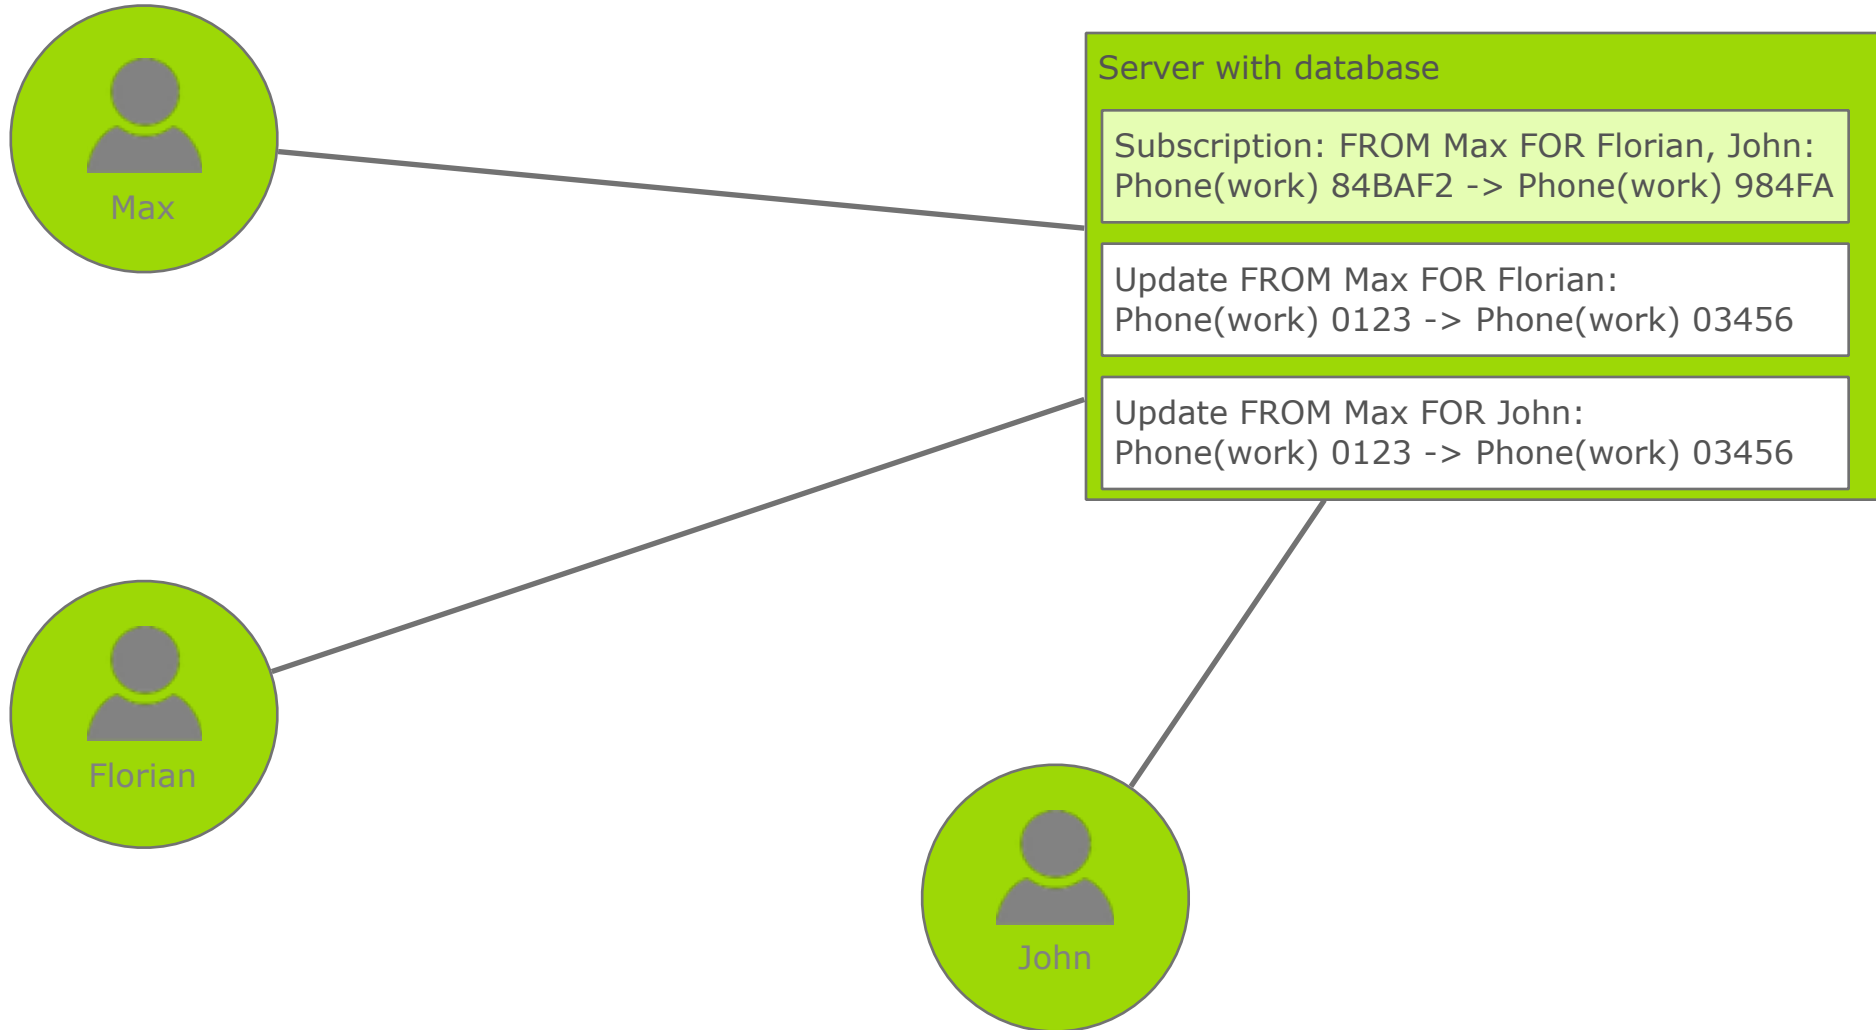

The Problem: With Twist

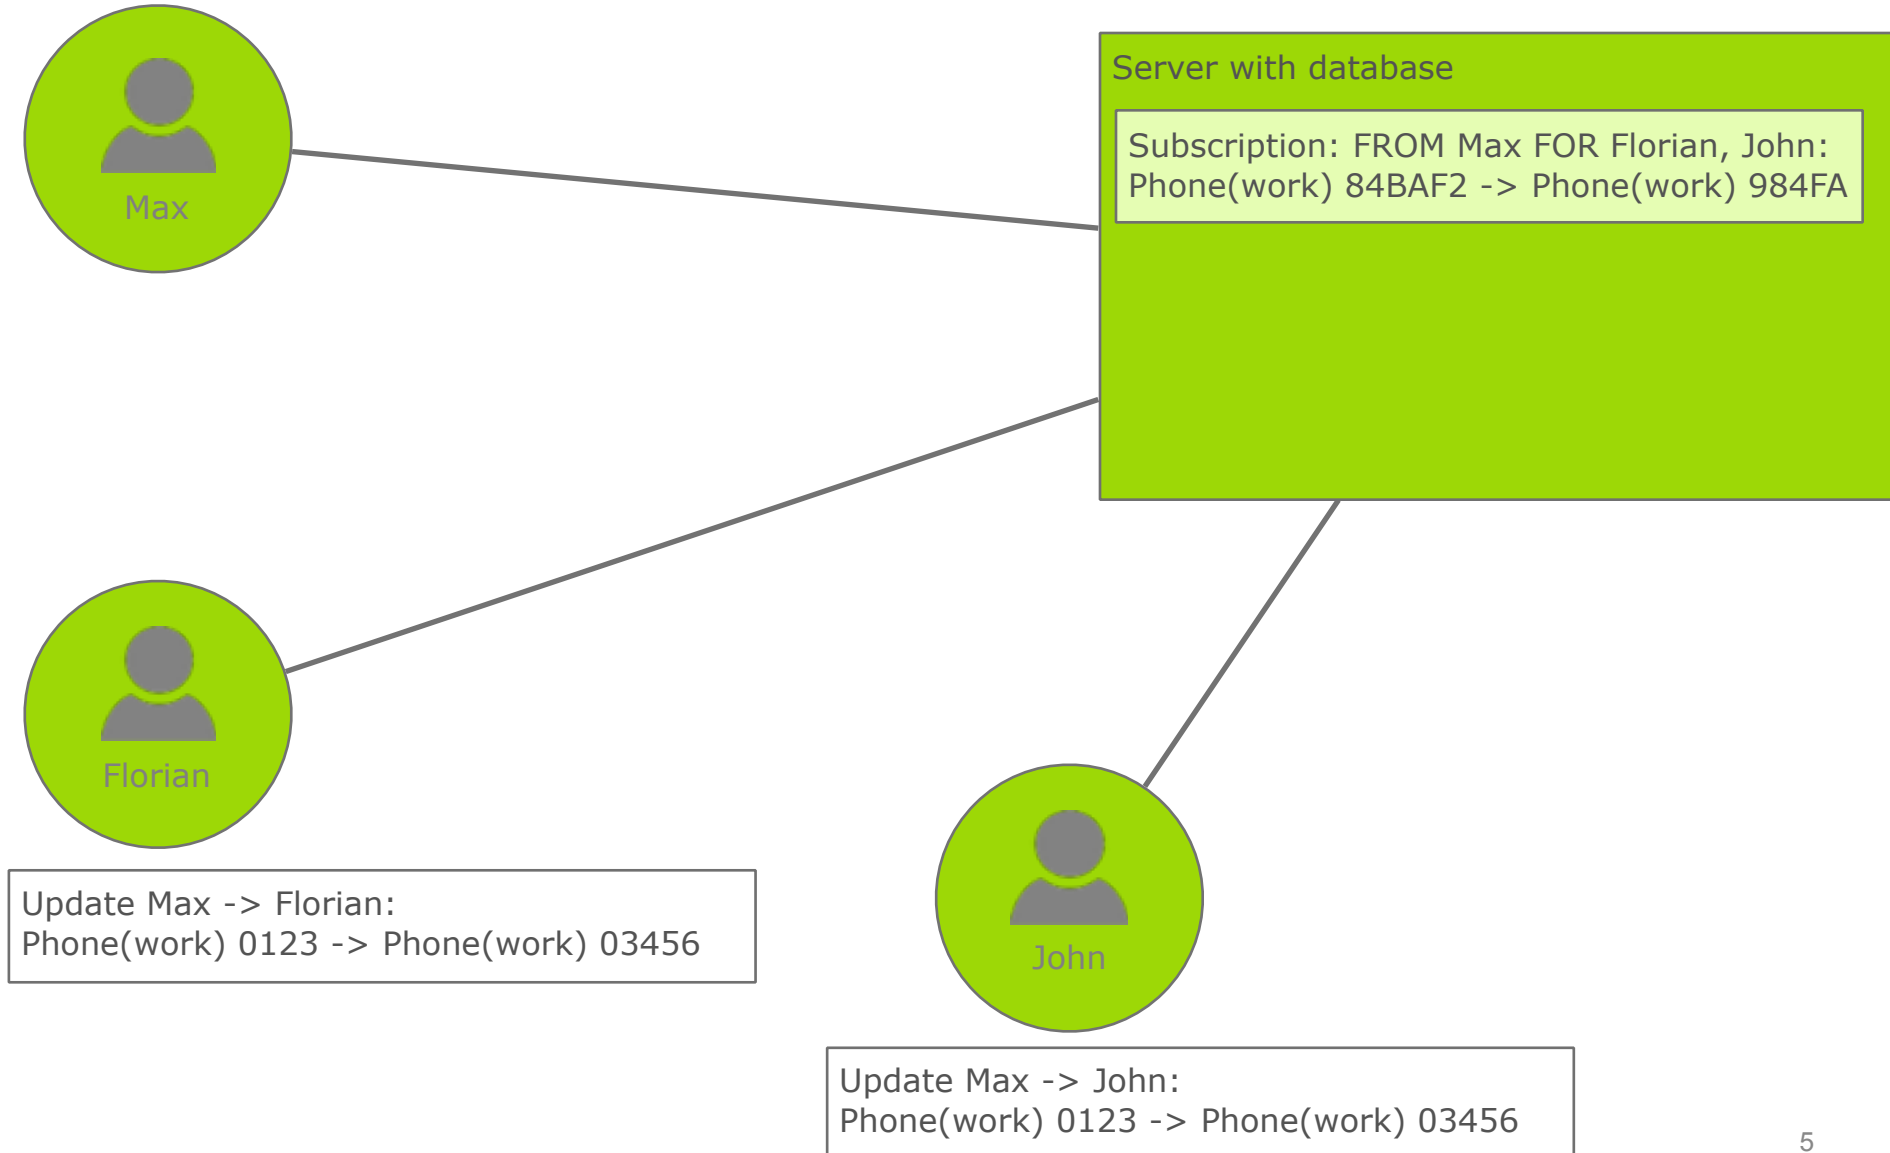

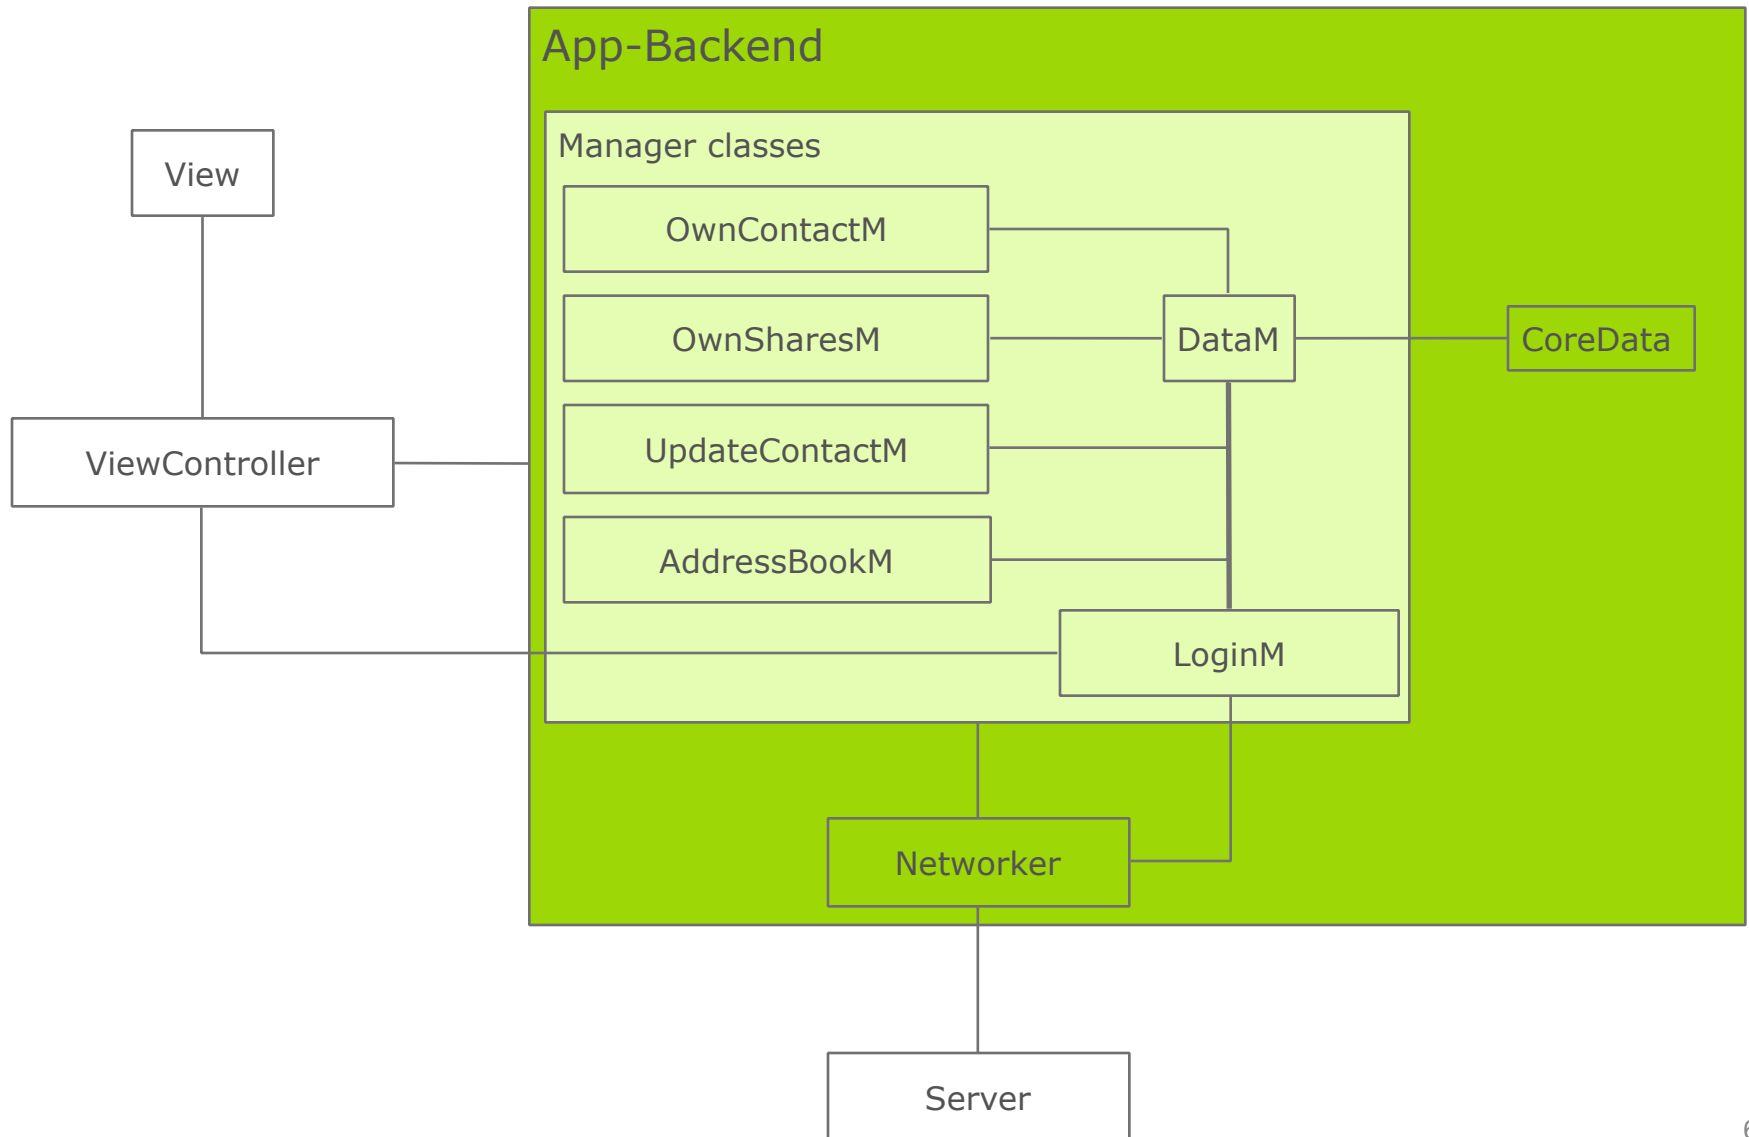

mongoDB

NoSQL database

mongoose

elegant object
modeling for
mongoDB

Node.js

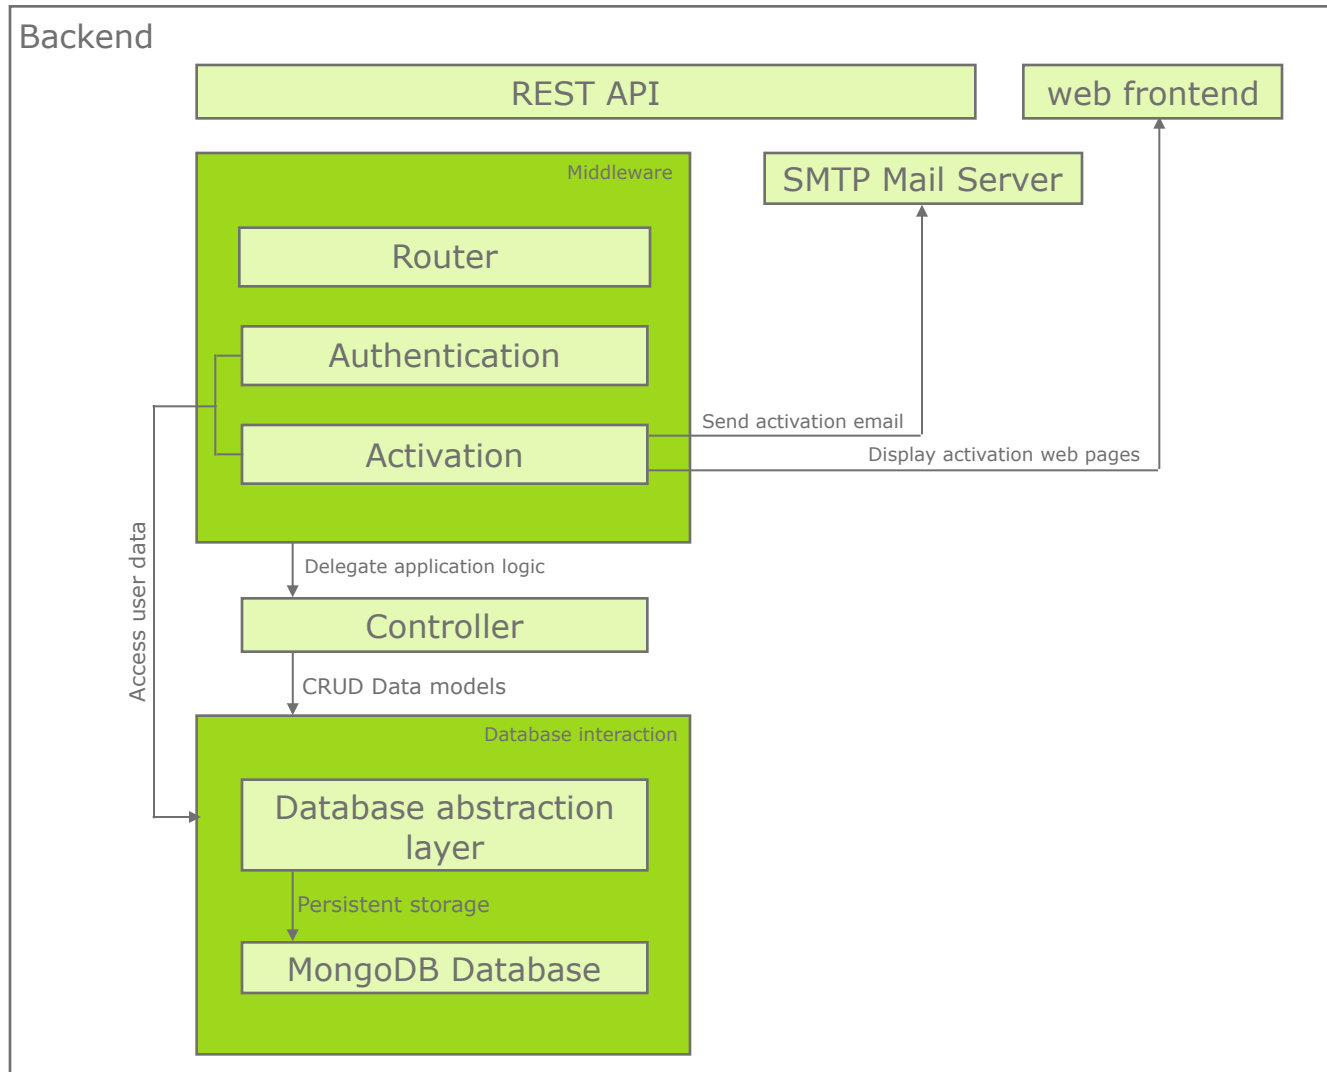

JS runtime environment for server
applications

Express

web application framework

mocha

test framework

Ubuntu 14.04 LTS hosted on digitalocean.com

- smart communication
 - App's caching mechanism enables adaption to low bandwidth and connectivity issues (save requests until response and eliminate duplicates)
 - Timestamps in requests enable smart REST API requests:

```
IF timestamp_app OLDER THAN timestamp_server
    send new data
ELSE
    send message: nothing changed
```

- Identification and mapping of address book entries
 - Unique combination of *type*, *label*, *hashedValue* identify one address book entry:

```
{  
  type: "phone",  
  label: "iPhone",  
  hashedValue: "C34EF12"  
}
```

- Saving Arrays of *oldLabels* and *oldValueHashes* allows mapping updates to existing entries

- Server adds unique ID to each entry
- Querying over ID enables easier communication between App and Server
- CoreData In-App database allows mapping of IDs and *(type, label, hashedValue)*-Keys on user's address book

- early user testing (Testflight) and bug tracker highly important
- REST API definition anything but trivial
- non-sequel databases require to think differently
- test driven development is crucial for server implementation

Thank you.
