

The Adventurer App

The optimal solution for people
exploring the world

Application Scenario

Can you imagine travelling around as an hitchhiker searching for:

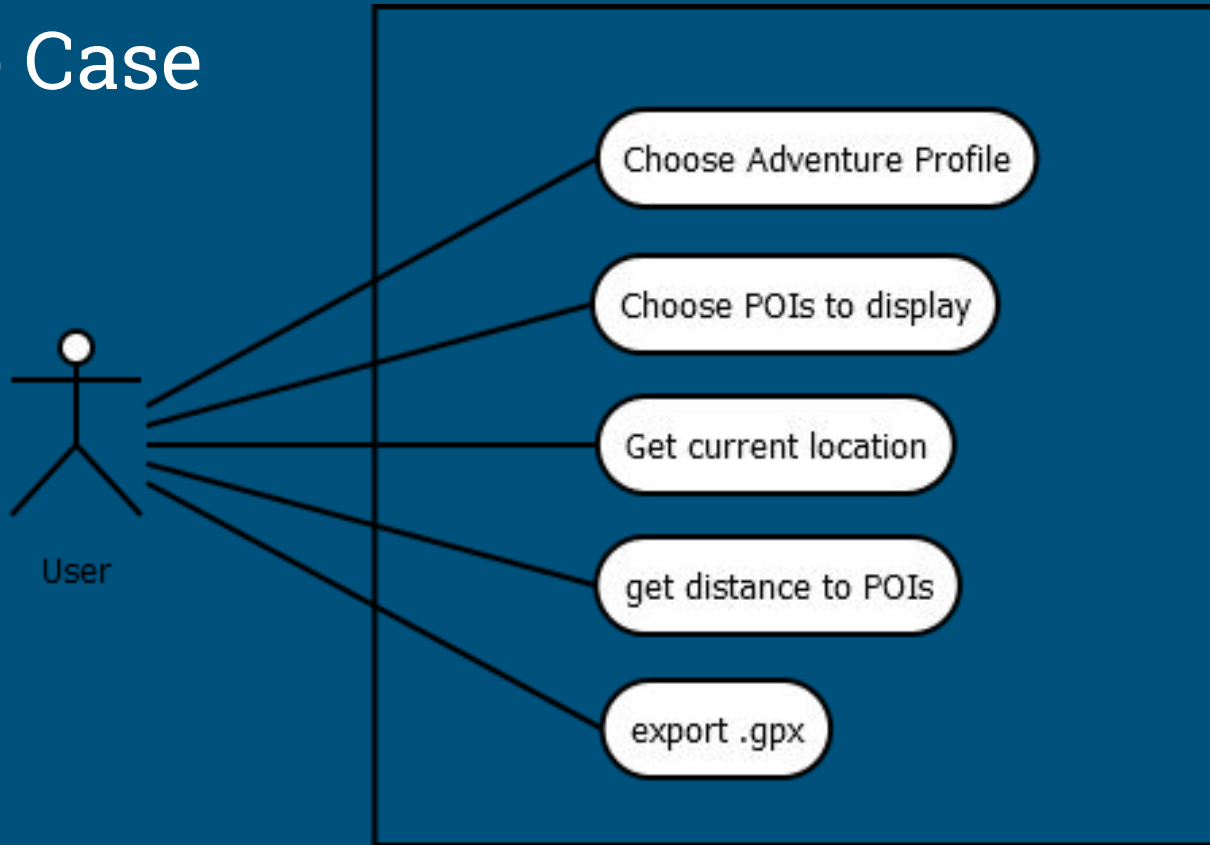

- the closest water spot
- the next campsite
- a supermarket

→ **You will quickly find yourself in a situation where you**

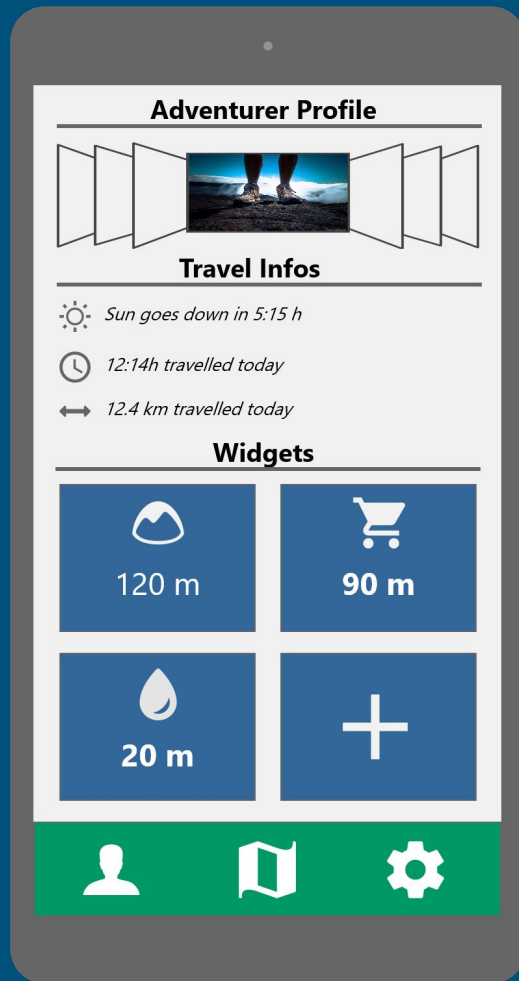

- waste a lot of time typing your searches into different navigation apps
- consume much battery power through non optimized GPS-Behaviour

Use Case

Mockup

Challenges

Offline Challenge

- You will probably come into areas with limited or even no connection

Solution

→ You can download maps for offline usage

Energy Challenge

- While using GPS you will consume a lot of energy
- Possibilities to reload are limited when in the nature

Solution

→ WiFi to navigate (if possible)

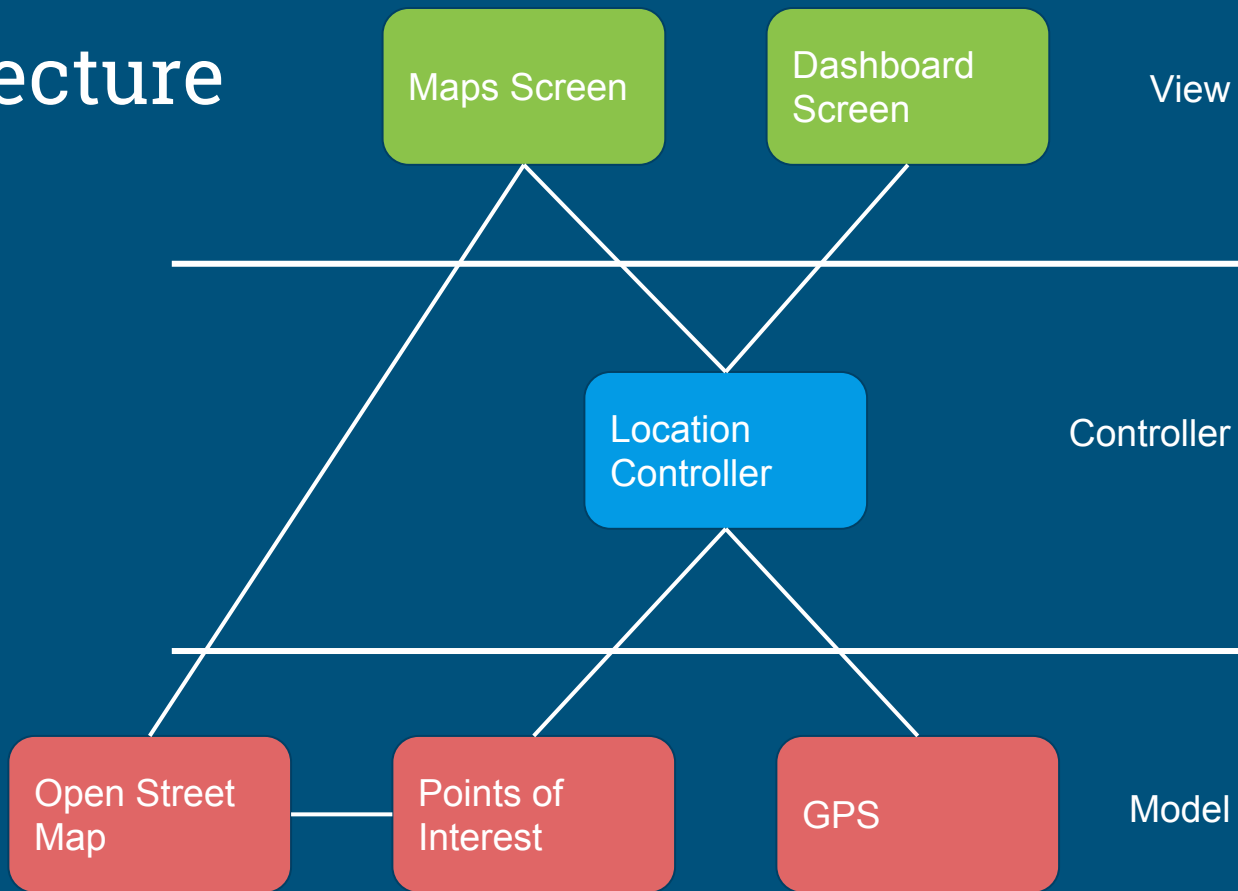

→ Request location as seldom as possible

Technology to Use

- Operating System: Android only
- Language: Kotlin
- IDE: Android Studio 3
- Maps: Open Street Map
 - *free and public API, downloadable map data*

Architecture

Work Plan

- Create minimal/functional UI
- Begin implementing the core of the app -> GPS and location management
- Other parts of the app are build upon that
- Refine UI and add smaller features
